Ministry of Agriculture,  
Food and Rural Affairs

**Discard old editions of this publication.** Each year the appropriate sub-committee of the Ontario Pest Management Research and Services Committee reviews the pesticides listed in this publication. To the best knowledge of the committee, at the time of printing, the pesticide products listed in this publication were:

- federally registered
- classified by the Ministry of the Environment (MOE)

**The information in this publication is general information only.** The Ontario Ministry of Agriculture, Food and Rural Affairs (OMAFRA) does not offer any warranty or guarantee, nor does it assume any liability for any crop loss, animal loss, health, safety or environmental hazard caused by the use of a pesticide mentioned in this publication.

This publication lists a number of brand names of pesticides. It is neither an endorsement of the product nor a suggestion that similar products are ineffective.

### **The Pesticide Label**

**Consult each product label before you use a pesticide.** The label provides specific information on how to use the product safely, hazards, restrictions on use, compatibility with other products, the effect of environmental conditions, etc.

The pesticide product label is a legal document. It is against the law to use the product in any other way.

### **Federal Registration of Pesticide Products**

The Pest Management Regulatory Agency (PMRA) of Health Canada registers pesticide products for use in Canada based on following an evaluation of scientific data to ensure that the product has merit and value; and the human health and environmental risks associated with its proposed use are acceptable.

#### **1. Full Registration**

Pesticide registrations are normally granted for a period of five years, subject to renewal.

#### **2. Conditional Registration**

Conditional registration may be granted for a specified, limited time period, where the registrant agrees to produce additional scientific or technical information, or the pesticide is used for emergency control of a serious pest outbreak.

### **Maximum Residue Limits**

**The PMRA has established maximum residue limits (MRLs) for pesticides.** Processors or retailers may demand more restrictive limits. Growers should seek advice of their intended market to determine if more restrictive limitations apply. Keep accurate and up-to-date records on pesticide use in each crop.

### **Supplemental Labels**

You MUST obtain a supplemental label and follow all the label directions when PMRA approves new uses for a registered pesticide that do not appear on the current label.

Examples of when you must use a supplemental label include:

- Emergency Use Registration
- Minor Use Label Expansion

You can obtain a copy of a supplemental label from the pesticide manufacturer or pesticide vendor, the grower association that sponsored the emergency registration or minor use, from OMAFRA or PMRAs Pest Management Information Service.

For more information on the federal registration status check the PMRA website at [www.pmra-ara.gc.ca](http://www.pmra-ara.gc.ca) or call 1-800-267-6315.

### **Regulation of Pesticides in Ontario**

The MOE is responsible for regulating pesticide sale, use, transportation, storage and disposal in Ontario. Ontario regulates pesticides by placing appropriate education, licensing and/or permit requirements on their use, under the *Pesticides Act* and Regulation 63/09.

All Pesticides must be used in accordance with requirements under the *Pesticides Act* and Regulation 63/09, which are available on the e-laws website at [www.e-laws.gov.on.ca](http://www.e-laws.gov.on.ca) or call ServiceOntario Publications Toll-Free number: 1-800-668-9938 or 416-326-5300.

### **Classification of Pesticides**

The Ontario Pesticides Advisory Committee (OPAC) is responsible for reviewing and recommending to the MOE, the classification of pesticide products before they can be sold or used in Ontario. Once approved by the MOE, classified products are posted on the MOE website: [www.ene.gov.on.ca](http://www.ene.gov.on.ca).

### **Certification and Licensing**

#### **Growers and their Assistants**

For information about certification for growers and training for assistants check the Ontario Pesticide Education Program website: [www.opec.ca](http://www.opec.ca) or call 1-800-652-8573.

#### **Commercial Applicators and their Assistants**

For more information about exterminator certification and licensing and technician training check the Ontario Pesticide Training & Certification website at [www.ontariopesticide.com/OPTC/default.htm](http://www.ontariopesticide.com/OPTC/default.htm) or call 1-888-620-9999 or 519-674-1575.

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

# 1. MANAGEMENT STRATEGIES FOR PROBLEM WEEDS

Problem perennial and biennial weeds are challenging to control because they typically have extensive root systems that can propagate new shoots. Although difficult to eradicate it is possible to minimize the impact perennial weeds have by eliminating top growth and providing competition from desired vegetation to exhaust the root system. An integrated approach that uses tillage, cover crops and effective herbicides has proven to be the most effective way to reduce populations of problem weeds. This chapter provides a summary of over three decades of public research that has investigated management strategies for some of the most challenging weed species.

## Crop Rotation

A number of long term studies have demonstrated that the density of perennial weeds increases under monoculture cropping system compared to cropping rotations consisting of three or more crops.

## Cover Crops

The inclusion of cover crops such as rye, red clover, buckwheat and oilseed radish or overwintering crops like winter wheat or forages in the cropping system will suppress perennial weed growth and reduce seed production of annual and perennial weeds. Fast growing crops or crops exhibiting allelopathic properties will also suppress weed growth. It is best to kill off a lush cover crop prior to winter so that the above ground biomass can decompose prior to planting in the spring.

## Tillage Systems

The type of tillage implement used and the depth at which the ground is tilled has been shown to influence the density of perennial and biennial weeds. No-till systems are more likely to increase perennial weed populations due to a lack of underground root disruption. Deep tillage (greater than 15 cm) with a moldboard plough has been shown to decrease populations of Canada thistle and perennial sow-thistle. The choice of tillage system used on any particular field should be based primarily on the soil

type and slope of the land so as to minimize erosion. Its benefits to weed control should only be taken advantage of when it has the sustainability of the top soil as the priority.

## Herbicide Selection

In general, the use of postemergence herbicides results in more successful top growth control of perennial and biennial weeds compared to preemergence herbicides. The strategy with in-crop postemergence herbicides is to kill off top growth so that the perennial plant must use its root reserves to generate new top growth. Every opportunity should be made to apply a systemic herbicide (e.g. glyphosate) in the fall months as the combination of shorter day lengths and cooler temperatures triggers many perennial weeds to begin allocating carbohydrates to the roots for over-wintering, which allows for translocation of a systemic herbicide down to the roots resulting in density reductions the next spring. Below are the most successful herbicide strategies for corn, soybean and cereal production on 16 different species based on University of Guelph comparative research trials conducted over the past 20 years.

## **ALFALFA, VOLUNTEER (RETIRED STAND)**

**IMPORTANT:** An old retired stand of alfalfa must be controlled prior to the planting of a field crop. Ideally this decision can be made in the fall so that the old stand can be tilled with a moldboard plough. If ploughing is not an option or if using a minimum till cropping system, a 3 year study by the University of Guelph demonstrated that an early spring application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) + 2,4-D Ester (564 g/L) at 0.5 L/ac (1.25 L/ha) + non-ionic surfactant at 0.5% v/v provided the most consistent control of alfalfa compared to both fall and spring applications of other treatments. Only corn can be planted after a spring application of this treatment.

### **Corn – Conventional**

In limited comparative trials postemergence applications of dicamba (e.g. BANVEL II) at 0.5 L/ac (1.25 L/ha), dicamba/atrazine (e.g. MARKSMAN) at 1.5 L/ac (3.75 L/ha) and DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha) have provided suppression of volunteer alfalfa. When either dicamba, dicamba/atrazine or DISTINCT is tank-mixed with ACCENT, OPTION or ULTIM, control of volunteer alfalfa is improved.

Expectation for control: 70–75%

### **Soybeans – Conventional**

If fall herbicide applications have not been made in reduced tilled soybeans, then the tank-mix of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) + AMITROL 240 at 1.68 L/ac (4.2 L/ha) applied 10–14 days preplant provides the best control of alfalfa.

Expectation for control: 75–85%

Once soybeans have emerged, volunteer alfalfa is virtually impossible to control. REFLEX or BLAZER will burn the leaf tissue of volunteer alfalfa but the plants will grow out of the injury in 2–3 weeks. Volunteer alfalfa is tolerant to all other postemergence soybean herbicides.

Expectation for control: 40–50%

### **Cereals**

In limited comparative trial work, cereal herbicides containing dichlorprop/2,4-D (e.g. ESTAPROP XT, TURBOPROP) provided the best suppression of volunteer alfalfa.

Expectation for control: 60–70%

### **Corn – Herbicide Tolerant**

In glyphosate tolerant ("Roundup Ready") corn, glyphosate can be tank-mixed with either dicamba (e.g. BANVEL II) or dicamba/atrazine products (e.g. MARKSMAN). The co-pack called GALAXY 2 (glyphosate + ULTIM) has also demonstrated reasonably good control of volunteer alfalfa.

Expectation for control: 70–80%

### **Soybeans – Herbicide Tolerant**

In glyphosate tolerant ("Roundup Ready") soybean, control of volunteer alfalfa is listed on the ROUNDUP WEATHERMAX (540 g/L) label when applied at a rate of 1.87 L/ac (4.67 L/ha).

Expectation for control: 70–80%

## BINDWEED, FIELD

### Corn – Conventional

In limited comparative trials, postemergence applications of dicamba (e.g. BANVEL II) at 0.5 L/ac (1.25 L/ha) or DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha) have provided the most consistent control of emerged field bindweed.

Expectation for control: 75–85%

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, sequential applications of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) applied at the 2–3 leaf stage of corn and then again at the 7–8 leaf stage of corn to emerged field bindweed provided the most consistent level of control. Alternatively, a single application of glyphosate (360 g/L) at 2 L/ac (5 L/ha) provided comparable control to the sequential applications.

Expectation for control: 75–85%

In glufosinate tolerant ("Liberty Link") corn, suppression of top growth can be achieved when LIBERTY is applied twice, to emerged field bindweed. The first application typically being at the 3 leaf stage of corn and at a rate of 1 L/ac (2.5 L/ha) followed by a second application at the 7–8 leaf stage of corn at a rate of 0.8 L/ac (2 L/ha). Alternatively you could tank-mix LIBERTY with dicamba (e.g. BANVEL II) and apply once to emerged field bindweed between the 2–6 leaf stage of corn.

### Soybeans – Conventional

Postemergence applications of BLAZER at 1 L/ac (2.5 L/ha) or BASAGRAN FORTE at 0.9 L/ac (2.25 L/ha) can burn back the foliage of field bindweed when applied during periods of high heat, high humidity and adequate soil moisture. However, field bindweed will grow back.

Expectation for control: 40–50%

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, sequential applications of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) applied at the 1st trifoliolate stage of soybean and then again at the 4th trifoliolate stage of soybean to emerged field bindweed provided the most consistent level of control. Alternatively, a single application of glyphosate (360 g/L) at 2 L/ac (5 L/ha) provided comparable control to the sequential applications.

Expectation for control: 75–85%

### Cereals

The challenge with field bindweed control in cereal crops is that the weed often emerges after the appropriate crop stage for herbicide applications. In winter wheat some producers have had success in applying bromoxynil/MCPA in the fall to suppress field bindweed growth the following spring. The single most important management practice that a grower can implement to reduce field bindweed is with either a pre-harvest glyphosate (360 g/L) application at 1 L/ac (2.5 L/ha) or with an application of glyphosate (360 g/L) at 1.5 L/ac (3.75 L/ha) after cereal harvest, typically in mid to late September, after field bindweed has re-grown. Both application timings will decrease the level of field bindweed to manage in the following spring. A pre-harvest application is preferred if field bindweed is at a population density that is problematic for harvesting.

## BLACK MEDICK

Refer to management strategies for ALFALFA, page 2 as they apply equally to Black medick.

## BUR CUCUMBER

### Corn – Conventional

Sequential applications provide the most consistent level of control. Either CONVERGE XT or PRIMEXTRA II MAGNUM should be applied preemergence followed by a postemergence application of bromoxynil (e.g. PARDNER) + AATREX 480 or CALLISTO + AATREX 480. Bromoxynil + AATREX 480 is best applied when bur cucumber is at the 4–6 leaf stage of growth.

Expectation for control: 85–90%

### Soybeans – Conventional

Sequential applications provide the most consistent level of control. In comparative trials the best control of bur cucumber was achieved when SENCOR 75DF was applied preemergence at 0.6 kg/ac (1.5 kg/ha) followed by an application of either CLASSIC at 14 g/ac (35 g/ha) with a non-ionic surfactant at 0.2% v/v or PINNACLE SG at 4.8 g/ac (12 g/ha) with a non-ionic surfactant at 0.1% v/v to bur cucumber at the 4–6 leaf stage of growth.

Expectation for control: 75–80%

### Cereals

Typically not found in winter cereals as the crop produces enough ground cover to inhibit the germination of this summer annual weed. Cereal herbicides have not been evaluated. However in field corn, the active ingredient bromoxynil has shown to have reasonable activity on bur cucumber, therefore cereal herbicides that contain bromoxynil (e.g. BUCTRIL M, INFINITY) should provide some control of this species in cereals.

## CANADA THISTLE

### Corn – Conventional

In comparative trials postemergence applications of DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha) has provided excellent control of Canada thistle. Other herbicides like dicamba (e.g. BANVEL II) or dicamba/ atrazine (e.g. MARKSMAN) also have good activity on Canada thistle. CALLISTO + AATREX 480 will provide suppression.

Expectation for control (with DISTINCT): 90% top growth control

### Soybeans – Conventional

Consistent control of Canada thistle is difficult to obtain in non-GMO (conventional) soybeans. In comparative trials CLEANSWEEP, BLAZER, PURSUIT or REFLEX + TURBOCHARGE were all capable of providing acceptable levels of top growth control when low populations of Canada thistle were present. However, all 4 products are inconsistent in their ability to deliver acceptable control with the most consistent product being CLEANSWEEP.

Expectation for control: 55–90% top growth control

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, the most consistent bur cucumber control has been achieved when glyphosate (360 g/L) is applied twice to emerged bur cucumber, with the first application occurring at the 2–3 leaf stage of corn and the second at the 7–8 leaf stage of corn. Bur cucumber at the 4–6 leaf stage requires a glyphosate (360 g/L) rate of 2 L/ac (5 L/ha) to provide adequate control.

Expectation for control: 85–90%

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, sequential applications of glyphosate (360 g/L) applied at the 1st trifoliolate stage of soybean and then again at the 4th trifoliolate stage of soybean provided the most consistent level of control. Bur cucumber at the 4–6 leaf stage requires a glyphosate (360 g/L) rate of 2 L/ac (5 L/ha) to provide adequate control.

Expectation for control: 85–90%

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, target actively growing Canada thistle at the rosette stage and no larger than 50 cm in height with an application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha). It is not advisable to tank-mix DISTINCT + glyphosate because of increased risk of crop injury.

Expectation for control: 90% top growth control

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, target actively growing Canada thistle at the rosette stage and no larger than 50 cm in height with an application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha).

Expectation for control: 90% top growth control

## CANADA THISTLE

### Cereals

The challenge with Canada thistle control in cereal crops is that the weed often emerges after the appropriate crop stage for herbicide applications. If emerged prior to the flag leaf stage of cereals, dichlorprop/2,4-D, TROPHY and MCPA Ester have provided the best top growth control. The single most important management practice that a grower can implement to reduce Canada thistle is with either a pre-harvest glyphosate (360 g/L) application at 1 L/ac (2.5 L/ha) or with an application of glyphosate (360 g/L) at 1.5 L/ac (3.75 L/ha) after cereal harvest, typically in mid to late September, after Canada thistle has re-grown to 20–25 cm. Both application timings will decrease the level of Canada thistle to manage in the following spring. A pre-harvest application is preferred if Canada thistle is at a population density that is problematic for harvesting.

## CHAMOMILE, SCENTLESS

**IMPORTANT CONSIDERATION:** Scentless chamomile is extremely difficult to control once in its second year of growth. Successful management of this species relies on removing newly germinated plants. Since this species germinates and emerges in both the fall and spring, effective management must be initiated during both those emergence periods. Experience has shown that trying to control fall germinated scentless chamomile with selective herbicides in the spring often results in poor performance. Established plants are best controlled in the fall with either glyphosate (360 g/L) at 2 L/ac (5 L/ha) or tillage with a moldboard plough.

### Corn – Conventional

Control prior to planting is essential. Given the large fibrous root mass of 2nd year and older plants, only the moldboard plough is an effective tillage method for control. Herbicide control is best obtained with preplant applications of glyphosate (360 g/L) at 2 L/ac (5 L/ha). Any postemergence herbicides tested in comparative trials did not adequately control scentless chamomile.

Expectation for control: 80–90%

### Soybeans – Conventional

Use the same strategy as for corn (conventional). None of the postemergence herbicides in soybeans have achieved more than 45% visual control. BLAZER at 1 L/ac (2.5 L/ha) is the most active on scentless chamomile.

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, preplant applications of glyphosate (360 g/L) at 2 L/ac (5 L/ha) provide the best level of control. It is advisable not to wait until corn has emerged to apply glyphosate as this weed will only get larger and more difficult to control.

Expectation for control: 80–90%

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, preplant applications of glyphosate (360 g/L) at 2 L/ac (5 L/ha) provide the best level of control. It is advisable not to wait until soybeans have emerged to apply glyphosate as this weed will only get larger and more difficult to control.

Expectation for control: 90% top growth control

### Cereals

In winter wheat a "two application" system works best whereby the first herbicide is applied in the fall to emerged winter wheat and the second application is made in the spring during the tillering to first node stage of winter wheat. In comparative trials, REFINE SG, REFINE M and bromoxynil/MCPA have all provided good control of scentless chamomile, provided it is no bigger than the 6 leaf stage of growth. Therefore, one strategy to achieve optimum control of fall germinated scentless chamomile would be to apply bromoxynil/MCPA in the fall and then REFINE SG in the spring if spring germinated seedlings are present.

## CLOVER, RED

**IMPORTANT:** A lush stand of red clover, either as a cover or forage crop must be controlled in the fall if the intention is to plant a field crop in the spring. If one waits until the spring to control a stand of red clover, the level of control will not be as good and it will take that thick biomass at least 3–4 weeks to decompose enough to make a suitable seedbed. A fall moldboard plough is the only type of tillage that effectively buries a red clover stand. For minimum till cropping systems, a fall application of glyphosate (360 g/L) at 1.5 L/ac + either dicamba (e.g. BANVEL II) at 0.25 L/ac (0.625 L/ha) or DISTINCT at 115 g/ac (285 g/ha) is the most effective way to remove a red clover stand.

### Corn – Conventional

If glyphosate + dicamba was not applied in the fall, then it should be applied in the spring 2 weeks prior to corn planting.

If red clover plants have escaped tillage treatments, such volunteer plants can be controlled with postemergence applications of either dicamba (e.g BANVEL II) at 0.25 L/ac (0.625 L/ha), or DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha). When these broadleaf herbicides are tank-mixed with either ACCENT, OPTION or ULTIM, control of volunteer red clover is improved. CALLISTO + AATREX 480 when applied postemergence can also provide good control of volunteer red clover.

Expectation for control: 95%

### Soybeans – Conventional

In reduced tilled soybeans without any fall control of red clover, the tank-mix of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) + AMITROL 240 at 1.68 L/ac (4.2 L/ha) applied 10–14 days preplant provides the best control of red clover.

Expectation for control: 85–90%

Once soybeans have emerged, red clover is virtually impossible to control. REFLEX or BLAZER will burn the leaf tissue of red clover but the plants will grow out of the injury in 2–3 weeks. Red clover is tolerant to all other postemergence soybean herbicides.

Expectation for control: 40–50%

### Cereals

The under-seeding of red clover in cereals has numerous benefits and is desired. Therefore if controlling weeds in a winter wheat crop under-seeded to red clover, herbicides which minimize clover injury should be used. Bromoxynil/MCPA, MCPA sodium, and MCPA/MCPB products are all registered for use on winter wheat under-seeded to red clover. From 2007–2009, the University of Guelph evaluated the biomass of red clover following winter wheat harvest and after in-crop applications of 7 registered cereal herbicides. Over 19 trials, the order of greatest to least red clover biomass by herbicide was bromoxynil/MCPA > REFINE M > TROPHY > 2,4-D Ester > dichlorprop/2,4-D > TARGET > INFINITY.

### Corn – Herbicide Tolerant

If glyphosate + dicamba was not applied in the fall, then it should be applied in the spring 2 weeks prior to corn planting.

In glyphosate tolerant ("Roundup Ready") corn, glyphosate could be used at a lower use rate and tank-mixed with either dicamba or dicamba/atrazine products.

Expectation for control: 95%

### Soybeans – Herbicide Tolerant

In reduced tilled soybeans without any fall control of red clover, the tank-mix of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) + AMITROL 240 at 1.68 L/ac (4.2 L/ha) applied 10–14 days preplant provides the best control of red clover.

Expectation for control: 85–90%

If red clover escapes the preplant treatment above and is present in emerged glyphosate tolerant ("Roundup Ready") soybeans, glyphosate (360 g/L) at 1.5 L/ac (3.75 L/ha) should provide adequate control.

Expectation for control: 80–85%

## DANDELION

### Corn – Conventional

A tank-mix of OPTION 2.25 OD at 0.63 L/ac (1.56 L/ha) or ULTIM at 13 g/ac (33 g/ha) + DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha) has provided the best control of dandelion in comparative trials. DISTINCT applied alone provides less visual control than when tank-mixed with OPTION or ULTIM.

Expectation for control: 75–85%

### Soybeans – Conventional or Herbicide Tolerant

GUARDIAN (a co-pack of POLARIS + CLASSIC) applied preplant has provided the best control of dandelion in comparative trials with visual control roughly 10% higher than what GUARDIAN PLUS (a co-pack of POLARIS + CLASSIC + VALTERA) has provided.

### Cereals

Comparative trials have shown that INFINITY and dichlorprop/2,4-D products have provided the best control of larger dandelions, however results can be inconsistent especially under dryer soil conditions (visual control range of 50–95%). Smaller dandelions can be suppressed with REFINE M and 2,4-D (visual control range of 40–75%). The optimal time to control dandelions is post cereal harvest with glyphosate (360 g/L) applied typically in mid September to early October at a rate of 1 L/ac (2.5 L/ha) if dandelions are 15 cm in diameter or less or at a rate of 2 L/ac (5 L/ha) if dandelions are larger than 15 cm in diameter.

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, glyphosate (360 g/L) applied at 2 L/ac (5 L/ha) provides suppression of dandelion. The practice of tank-mixing a herbicide like dicamba, dicamba/atrazine or CALLISTO + AATREX 480 with glyphosate has not improved the level of dandelion control in limited comparative trials.

Expectation for control: 65–70%

## HORSETAIL, FIELD

### Corn – Conventional

Either OPTION 2.25 OD at 0.63 L/ac (1.56 L/ha), ULTIM at 13 g/ac (33 g/ha) + non-ionic surfactant at 0.2% v/v, ACCENT at 13 g/ac (33 g/ha) + non-ionic surfactant at 0.2% v/v or BROADSTRIKE RC have activity on field horsetail but effectiveness varies greatly by population.

Expectation for control: 50–95%

### Corn – Herbicide Tolerant

Field horsetail is fairly tolerant to glyphosate. In glyphosate tolerant ("Roundup Ready") corn, the combination packs (co-packs) of GALAXY 2 (glyphosate + ULTIM) or BROADSTRIKE RC will provide the best opportunity for top growth control of field horsetail. Although MCPA is effective at controlling field horsetail, it is not recommended that MCPA be tank-mixed with glyphosate and applied to emerged corn for the purposes of controlling field horsetail as unacceptable crop injury and yield losses have been observed.

Expectation for control: 50–95%

### Soybeans – Conventional or Herbicide Tolerant

Either AMITROL 240 at 1.68 L/ac (4.2 L/ha) or glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) + BROADSTRIKE RC at 35 g/ac (87.5 g/ha) applied preplant to soybeans has provided the best control of field horsetail. However, susceptibility of field horsetail to this treatment varies significantly by population.

Expectation for control: 45–99%

### Cereals

Comparative trials have shown that any cereal herbicide that contains the active ingredient MCPA will provide very effective top growth control of field horsetail.

## HORSE NETTLE

### Corn – Conventional

Postemergence applications of ULTIM at 13 g/ac (33 g/ha) + non-ionic surfactant at 0.2% v/v tank-mixed with either DISTINCT, dicamba (e.g. BANVEL II), dicamba/atrazine (e.g. MARKSMAN) or PEAKPLUS has provided the best control in comparative trials.

Expectation for control: 75–95% top growth control

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, two 1 L/ac (2.5 L/ha) applications of glyphosate (360 g/L), the first at the 2–3 leaf stage of corn and the second at the 7–8 leaf stage of corn provide the most consistent level of control. A single application of glyphosate (360 g/L) applied at a rate of 2 L/ac (5 L/ha) also provides control but not as consistent as the two application strategy.

Expectation for control: 90–95%

### Soybeans – Conventional

FIRSTRATE at 8.5 g/ac (20.8 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2.5% v/v applied postemergence is the only herbicide to provide suppression of horse nettle in non-GMO (conventional) soybeans.

Expectation for control: 70–85% top growth control

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, two 1 L/ac (2.5 L/ha) applications of glyphosate (360 g/L), the first at the 1st trifoliolate stage of soybean and the second at the 3rd trifoliolate stage of soybean provide the most consistent level of control. A single application of glyphosate (360 g/L) at a rate of 2 L/ac (5 L/ha) also provides control but not as consistent as the two application strategy.

Expectation for control: 90–95%

### Cereals

There has been no public research done on horse nettle susceptibility to cereal herbicides. However, limited field experience would suggest that dichlorprop/2,4-D products (e.g. ESTAPROP XT, TURBOPROP, DICHLOPROP D) has some activity on horse nettle. The single most important management practice that a grower can implement to reduce horse nettle is with either a pre-harvest glyphosate (360 g/L) application at 1 L/ac (2.5 L/ha) or with an application of glyphosate (360 g/L) at 2 L/ac (5 L/ha) after cereal harvest, typically in mid to late September, after horse nettle has re-grown. Both application timings will decrease the level of horse nettle to manage in the following spring. A pre-harvest application is preferred if horse nettle is at a population density that is problematic for harvesting.

## MEDICK, BLACK

Refer to management strategies for ALFALFA, page 2 as they apply equally to Black medick.

## NUTSEDGE, YELLOW (NUT GRASS)

### Corn – Conventional

Preplant incorporated (PPI) applications of either DUAL II MAGNUM at 0.7 L/ac (1.75 L/ha) or FRONTIER MAX at 0.56 L/ac (1.4 L/ha) will suppress nutsedge growth. If either product is not applied PPI, nutsedge control will be reduced. In recent comparative trials, postemergence applications of BASAGRAN FORTE or CALLISTO + AATREX 480 were comparable but provided less than 50% visual control.

Expectation for control: 60–80%

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, nutsedge control with glyphosate is greatly affected by rate. A single application of glyphosate (360 g/L) applied at a rate of 2 L/ac (5 L/ha) will provide around 80% visual control of nutsedge whereas the 1 L/ac (2.5 L/ha) rate will typically provide less than 60% visual control.

Expectation for control (2 L/ac rate): 70–80%

## NUTSEDGE, YELLOW (NUT GRASS)

### Soybeans – Conventional

CLASSIC at 14 g/ac (36 g/ha) + non-ionic surfactant at 0.2% v/v applied postemergence has provided the best control of nutsedge in comparative trials. In fields with tremendous nutsedge pressure, some producers have opted to preplant incorporate either DUAL II MAGNUM or FRONTIER MAX at their highest labeled rate and then apply CLASSIC postemergence in soybeans.

Expectation for control (with CLASSIC): 90%

### Cereals

Typically not a huge problem in winter cereals since cereal growth will provide a level of competition that keeps nutsedge suppressed during the season. The majority of cereal herbicides provide little activity on nutsedge.

## SOW-THISTLE, PERENNIAL

### Corn – Conventional

In comparative trials postemergence applications of dicamba/atrazine (e.g. MARKSMAN) at 1.8 L/ac (4.5 L/ha) has provided the most consistent control of perennial sow-thistle while dicamba (e.g. BANVEL II) at 0.5 L/ac (1.25 L/ha) or DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha) have also provided good control of perennial sow-thistle.

Expectation for control 80–90% top growth control

### Soybeans – Conventional

In comparative trials all postemergence soybean herbicides can periodically provide some level of perennial sow-thistle control however none do consistently. CLEANSWEEP, BLAZER at 1 L/ac (2.5 L/ha), BASAGRAN FORTE at 0.9 L/ac (2.25 L/ha) and CLASSIC + non-ionic surfactant at 0.2% v/v provide top growth control, but typically sow-thistle will re-grow and be present at harvest. Pre-harvest glyphosate applications will have more impact on reducing perennial sow-thistle populations than any in-crop herbicide.

Expectation for control: 50–70% top growth control

### Cereals

The challenge with perennial sow-thistle control in cereal crops is that the weed often emerges after the appropriate crop stage for herbicide applications. If emerged during the tillering to nodal stage of cereals, dichlorprop/2,4-D, TROPHY and MCPA Ester have provided good top growth control. The single most important management practice that a grower can implement to reduce perennial sow-thistle is to use either a pre-harvest glyphosate (360 g/L) application at 1 L/ac (2.5 L/ha) or with an application of glyphosate (360 g/L) at 2 L/ac (5 L/ha) after cereal harvest, typically in mid to late September, after perennial sow-thistle has re-grown. Both application timings will decrease the level of thistles to manage in the following spring. A pre-harvest application is preferred if perennial sow-thistle is at a population density that is problematic for harvesting.

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, GUARDIAN (a co-pack of POLARIS + CLASSIC) applied postemergence to nutsedge has continually provided the best visual control.

A single application of glyphosate (360 g/L) applied at 2 L/ac (5 L/ha) will also provide control of nutsedge but consistently at 10–20% less than GUARDIAN.

Expectation for control: 95%

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, glyphosate (360 g/L) applied postemergence at 2 L/ac (5 L/ha) will provide good top growth control of perennial sow-thistle. It is not uncommon for perennial sow-thistle to re-grow after an application of glyphosate, therefore requiring follow-up applications.

Expectation for control 85–95% top growth control

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, glyphosate (360 g/L) applied postemergence at 2 L/ac (5 L/ha) will provide good top growth control of perennial sow-thistle. It is not uncommon for perennial sow-thistle to re-grow after an application of glyphosate, therefore requiring follow-up applications.

Expectation for control 85–95% top growth control

## QUACKGRASS

### Corn – Conventional

Either OPTION 2.25 OD at 0.63 L/ac (1.56 L/ha), ULTIM at 13 g/ac (33 g/ha) + non-ionic surfactant at 0.2% v/v or ACCENT at 13 g/ac (33 g/ha) + non-ionic surfactant at 0.2% v/v applied postemergence to quackgrass will provide excellent control.

Expectation for control 90–95% top growth control

### Soybeans – Conventional

If quackgrass has emerged before planting, a preplant burndown with glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) should be made.

For quackgrass that has emerged in the soybean crop, postemergence applications of ASSURE II at 0.3 L/ac (0.75 L/ha) + SURE MIX at 0.5% v/v, VENTURE at 0.8 L/ac (2 L/ha) or POAST ULTRA at 0.45 L/ac (1.1 L/ha) + MERGE at 0.8 L/ac (2 L/ha) will provide suppression/control of quackgrass. ASSURE II has been the most consistent of the three in limited comparative trials.

Expectation for control 70–85%

### Cereals

There are no products available in cereals that will control quackgrass. The single most important management practice that a grower can implement to reduce quackgrass is to use either a pre-harvest glyphosate (360 g/L) application at 1 L/ac (2.5 L/ha) or an application of glyphosate after cereal harvest, typically in mid to late September, after quackgrass has re-grown. Both application timings will decrease the level of quackgrass to manage in the following spring. A pre-harvest application is preferred if quackgrass is at a population density that is problematic for harvesting.

## VETCH, TUFTED

### Corn – Conventional

In comparative trials either dicamba (i.e. BANVEL II) at 0.25 L/ac (0.625 L/ha), DISTINCT at 115 g/ac (285 g/ha) + non-ionic surfactant at 0.25% v/v + 28% UAN at 2 L/ac (5 L/ha) or CALLISTO at 85 mL/ac (210 mL/ha) + AATREX 480 at 235 mL/ac (580 mL/ha) + non-ionic surfactant at 0.2% v/v have all provided good top growth control of tufted vetch.

Expectation for control: 80–90%

### Soybeans – Conventional

It is extremely difficult to control a perennial legume weed in an annual legume crop. Of all the herbicide programs tested over the past 10 years, a “two-pass” strategy of applying DUAL II MAGNUM + SENCOR preemergence followed by REFLEX + PINNACLE postemergence has provided the best suppression of vetch.

Expectation for control: 50–70%

### Corn – Herbicide Tolerant

In glyphosate tolerant (“Roundup Ready”) corn, target actively growing quackgrass that is 10–20 cm in height with an application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha).

Expectation for control: 90–95%

### Soybeans – Herbicide Tolerant

In glyphosate tolerant (“Roundup Ready”) soybean, target actively growing quackgrass that is 10–20 cm in height with an application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha).

Expectation for control: 90–95%

## VETCH, TUFTED

### Cereals

The challenge with vetch control in cereal crops is that the weed often emerges after the appropriate crop stage for herbicide applications. If emerged during the tillering to nodal stage of cereals, TROPHY, 2,4-D Ester, MCPA Ester and dichlorprop/2,4-D have all provided some level of top growth control. Post harvest herbicide applications made before the first frost (vetch is sensitive to cold air temperatures and is one of the first species to die off in the fall) are advantageous in decreasing the level of vetch to manage in the following spring. In limited comparative trial work, glyphosate (360 g/L) at 2 L/ac (5 L/ha) tank-mixed with either DISTINCT at 115 g/ac (285 g/ha) or dicamba (i.e. BANVEL II & ORACLE) at 0.5 L/ac (1.25 L/ha) significantly reduced the amount of vetch that emerged the following spring and into the summer.

## WIRE-STEMMED MUHLY

### Corn – Conventional

OPTION 2.25 OD at 0.63 L/ac (1.56 L/ha) provides the best control.

Expectation for control 80–95%

### Soybeans – Conventional

If wire-stemmed muhly has emerged before planting, a preplant burndown with glyphosate (360 g/L) at 1 L/ac (2.5 L/ha) should be made.

For wire-stemmed muhly that has emerged in the soybean crop, VENTURE at 0.8 L/ac (2 L/ha) will provide the best suppression/control of wire-stemmed muhly.

Expectation for control 75–95%

### Cereals

There are no products available in cereals that will control wire-stemmed muhly. The single most important management practice that a grower can implement to reduce this weed is to use either a pre-harvest glyphosate (360 g/L) application at 1 L/ac (2.5 L/ha) or an application of glyphosate after cereal harvest, typically in mid to late September, after wire-stemmed muhly has re-grown. Both application timings will decrease the level of wire-stemmed muhly to manage in the following spring. A pre-harvest application is preferred if wire-stemmed muhly is at a population density that is problematic for harvesting.

### Corn – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") corn, target actively growing wire-stemmed muhly that is 10–20 cm in height with an application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha).

Expectation for control: 80–95%

### Soybeans – Herbicide Tolerant

In glyphosate tolerant ("Roundup Ready") soybean, target actively growing wire-stemmed muhly that is 10–20 cm in height with an application of glyphosate (360 g/L) at 1 L/ac (2.5 L/ha).

Expectation for control: 80–95%

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 2. APPLICATION TECHNOLOGY

### Introduction

Herbicide application should be a precision operation. Recent advances in equipment and control systems can make the job relatively simple and precise.

Pesticides applied incorrectly may result in wasted pesticide, poor or no control, damage to crops (possibly the neighbour's) or environmental contamination. Every effort must be made to apply chemicals properly.

### Developments in New Equipment

In building sprayers that accurately apply herbicides, equipment manufacturers work closely with the crop-protection industry. Innovations, such as closed-injection systems with herbicide concentrate carried separately from the water carrier, are now in use. Electronic rate controllers provide more accurate spray application by utilizing speed sensors, flow controllers and microprocessors to maintain the desired application rate. This technology has also included radar to accurately sense true ground speed of the sprayer. Rate controllers are commonly used by professional applicators. GPS guidance control systems with possible auto steer allow sprayers to cover the field with minimal overlap swath to swath. This allows for complete field spray coverage while not double applying product in certain areas.

The industry is currently working towards the closed-injection system. Work continues in the area of drift reduction using air assist and electrostatic spray methods.

Air-induction nozzles significantly reduce spray drift and are available in a range of sizes from a number of suppliers. Operating these nozzles within their working pressure range is crucial to ensure designed spray angle development, proper air induction into the nozzle and necessary droplet size for the job at hand. Before buying air induction spray tips, make sure your sprayer pump can produce sufficient pressure to operate these tips under all conditions. Check with the nozzle manufacturers for operating pressures required. Most nozzle manufacturers a variety of air induction nozzles including both low-pressure and high pressure designs.

### Field Sprayers

The most common type of sprayer used in herbicide application is the boom sprayer. This sprayer applies a uniform amount of spray solution across the width of the boom.

The main requirements for field spraying are:

- uniform pressure across the whole boom
- all nozzles have the same output and a good spray pattern
- a constant forward speed in actual field conditions
- ability to adjust boom height so that the required nozzle-to-target height can be achieved
- a stable boom height to ensure proper overlap of the nozzle-tip patterns

Most commercially built sprayers can be adapted and used safely to apply liquid fertilizers. Extra agitation

may be required. Ensure that the sprayer components being used will resist the corrosive nature of some fertilizer formulations and follow the manufacturer's recommendations.

### Air-Blast or Mist Sprayers

These machines should never be used to apply herbicides, especially hormone-type herbicides such as 2,4-D. The danger of causing off-target crop injury at a great distance from the treated area is very high.

### Wiper Applicators for Selective Weed Control

Wiper applicators (rope-wick, roller applicator or similar devices) containing glyphosate can be used when the target weeds are taller than the crop so as to avoid contact with a crop sensitive to that herbicide. Other products may exist that can be wick applied. Refer to intended product labels for use of this application technique. The main criteria for using wiper applicators are:

- contact enough of the target plant to get herbicidal effectiveness
- keep the wick application above the crop to avoid crop injury

Travel speeds should be 4–10 km/hr for wick application. Two passes in opposite directions may be beneficial, especially in heavy weed infestations and where higher vehicle speed is contemplated. Care must be taken not to contact sucker growth in orchards, vineyards and shelterbelts. This may result in crop injury.

## Care and Use of Equipment

### Spraying Speeds

Since herbicides must be uniformly applied, the forward speed of a sprayer must be constant whenever the nozzles are delivering liquid. If the driving wheels of a tractor slip on the soil surface, the tractor's speedometer does not indicate a change in forward speed. To be certain that the forward speed is constant in spite of wheel slippage on hills, or loose soil, use an independent speedometer powered by a non-driven wheel or use newer radar or GPS speed sensors. Spray monitors and other electronic rate controllers also may be installed. Only rate controllers will automatically adjust for variation in tractor speed to maintain a constant rate of application.

### Water

Use only clean water that contains no debris, soil or organic matter. On your farm water supply, use a frost-free water hydrant located outside a building. An anti-backflow or anti-siphon valve should always be installed on any hydrant or water supply. Never allow the suction screen to rest on the bottom of a farm pond while filling a sprayer. The intake line near the screen must, by law, be equipped with a spring-loaded check valve or anti-backflow device to prevent contamination of the pond or stream when the pump is shut off. Tank-refilling nozzles, volume-booster nozzle or injection pumps should not be used to refill the sprayer tank from farm ponds or streams. These tank-refilling aids may cause pond or stream contamination.

### Agitation

When chemical formulations in solution are used (e.g. 2,4-D and water) at least 2–14 L of spray solution should be returned to the tank each minute to provide adequate agitation. Higher rates will apply with wettable powders. To be effective, the agitation line

from the pump should pass through a control valve and deliver the liquid to the bottom (not the top) of the tank. Agitation propellers, agitation nozzles or a sparge tube should always be used to ensure sufficient liquid circulation in the tank.

When wettable powders herbicides are used, the return to the tank should be 14–27 L/min for each 450 L of tank capacity. A dedicated line from the pressure side of the pump (not the pressure regulator) to the tank must be used to supply the liquid necessary for hydraulic agitation in the tank. Always use a venturi jet or sparge tube. This flow can be reduced if the sprayer has a mechanical agitator. Sparge tube agitation requires more water than venturi nozzles to give the same agitation.

Avoid excessive agitation of the mixture, as it may turn into an invert emulsion, a grease-like mass that will settle to the bottom of the tank and cannot be pumped. Excessive agitation may also cause foaming resulting in pumping problems. To prevent a build-up of oil in the sprayer, the tank should be emptied completely before refilling. After any break in the spraying operation, agitate thoroughly before resuming operation. Immediately after use, clean the tank and sprayer with a detergent or solvent and flush with clean water.

### Pumps

The pump is the most important part of the sprayer and should have adequate capacity to maintain the desired pressure, volume and agitation. Piston, diaphragm and centrifugal pumps are best for pumping wettable-powder suspensions. For liquid herbicide applications, roller pumps may be used in addition to the above types. When used for wettable powders or flowable formulations, choose a pump with an abrasion resistant housing. Carefully follow the manufacturer's care and storage instructions for the best pump performance.

**CAUTION:** Running a spray pump without water may cause damage or premature wear.

### Nozzle Tips

Numerous companies make spray nozzles. Nozzles from different suppliers may be similar in design but may differ in setup requirements. Always follow manufacturers' recommendations for nozzle spacing and nozzle-to-target distances. These distances may vary according to the spray angle of the nozzle. Proper spacing and orientation of nozzles is essential to ensure adequate overlap of adjacent nozzle spray plumes.

Care should be taken to maintain a stable boom height to ensure uniform overlap of the nozzle spray patterns.

The success of the spray application is dependent in part on the condition of the nozzle tips and the uniformity of application across the whole spray boom. The spray pattern of all nozzles should be examined prior to their use. In addition, every nozzle should be checked when calibrating the sprayer.

Materials used for nozzle tips range from brass, stainless steel, hardened stainless steel, as well as plastics/polymers and ceramics. All product formulations and carriers cause wear of the nozzle orifice. Wettable powders cause abrasive wear, more than other formulations.

Sprayers should be calibrated regularly. (See *Sprayer Calibration*, page 16).

Nozzle tips should be replaced when they deliver 10% more than manufacturer's rated output specifications or when their distribution pattern becomes unacceptable.

**FIGURE 2-1. Conventional vs. Air Induction Nozzles**

Flat fan nozzles are widely used on boom sprayers to apply herbicides. Spray operating pressures should be within limits specified by the nozzle manufacturer. Nozzles with a 110 degree spray angle have more overlap than 80 degree nozzles. This allows less chance of spray skips as the boom moves closer to the ground. Always follow manufacturer's recommendations for spacing minimum nozzle to target distance and spray operating pressures.

Air induction or venturi nozzles are now available from at least a dozen different suppliers. These nozzles were specifically designed to reduce the amount of fine droplets produced in the smaller nozzle sizes. The nozzle manufacturers offer air induction or venturi nozzles in a wide range of sizes.

These nozzles draw air into the nozzle as the spray liquid passes through the nozzle venturi. The result is a coarser spray with very few fine spray droplets that are prone to drift. These coarse droplets contain air bubbles that cause the droplets to rupture upon impact with plant surfaces.

Air induction nozzles are made in two pressure ranges, low pressure and high pressure. If a sprayer cannot exceed 345 kPa, only consider a low pressure design. All venturi nozzles should be operated in the middle of their working range. For the low pressure designs this is approximately 275 kPa and in the high pressure designs, about 550 kPa. All venturi nozzle designs are extremely sensitive to low working pressure. The spray patterns will collapse to less than their designed spray angle if the nozzle pressure is too low. In addition, the

induction of air into the spray liquid will not occur if the pressure goes below a certain point.

Many producers have quickly adopted this new nozzle technology. The significant reduction in spray drift, compared to conventional flat fan nozzles, is a welcome feature. See Figure 2-1, *Conventional vs. Air Induction Nozzles*, on this page. Some producers are using these nozzles for all their herbicide spraying.

Some product performance problems have occurred when air induction or venturi nozzles have been used. Poor timing of spray, reduced water volumes, spray pressures that are too low and difficult-to-wet weeds may all contribute to poor control.

Special "even flat fan" spray nozzles are available for band spraying of herbicides. These even flat fan nozzles deliver a uniform amount of spray over their sprayed area. A variety of sizes, spray angles and nozzle materials are available. The nozzle-to-target height, and spray angle of the nozzles as well as their orientation to the direction of travel, determines the width of the sprayed band. Carefully follow the manufacturer's literature and directions.

Flooding nozzle tips are used at low pressures and, because of their wide spray angle, can be used closer to the ground surface, thus reducing the potential for drift. New flooding nozzle tip designs have improved the spray distribution patterns to the point that it is as good as with the flat fan tips. Flooding nozzle tips are available in brass, plastic/polymers and stainless steel. Half as many of these nozzle tips are required to cover the same width as would be required with flat fan nozzles.

Full or hollow cone nozzle tips may be used for applying herbicides to the soil surface when the herbicide is mixed into the soil with a disk harrow, cultivator or similar tillage implement. These types of

nozzles will not provide as uniform spray distribution as flat fan nozzles setup correctly.

**NOTE:** When using any nozzle for spraying wettable powders or micro-nutrients, it is essential to calibrate the sprayer frequently because, as a nozzle wears, the quantity of spray material delivered increases and distribution is uneven. Worn nozzles usually result in a poor spray pattern.

Nozzle manufacturer's catalogues will list screens required for various nozzle types and sizes. Diaphragm check valve nozzle bodies will ensure dripless operation when the boom is turned off. To clean nozzle screens, remove them from the nozzle bodies and wash thoroughly with soap and water, using a nozzle tip brush. Simply flushing water through the boom and nozzles will not remove pesticide residue that has built up on the outside of the nozzle screens.

### Cleaning the Sprayer

Before cleaning the sprayer, dispose of surplus tank mix. As suggested in the Grower Pesticide Safety Course, one method of disposal is to dilute the remaining spray solution at least 10:1 with water. This diluted solution can be applied to the previously treated area as long as the maximum recommended product rate on the label, is not exceeded.

Clean out the sprayer immediately after finishing the day's work or when changing chemicals. At the end of each spray day, thoroughly flush out the boom with plenty of water to rinse lines, diaphragm check valves and nozzles. Delaying cleanout, even overnight, can allow the formation of hard-to-remove deposits. The sprayer tank is much more difficult to clean out, if it is allowed to dry. Don't forget to also clean out the measuring containers.

### Steps

1. Read the product label to determine the recommended cleaning procedure. Have all the materials required for the cleanup ready, including appropriate personal safety equipment.
2. Drain the spray tank.
3. Fill the tank with water and add detergent, ammonia or other tank cleaner product and agitate for 10–20 minutes (clean the whole tank not just the bottom half). Flush boom and hoses with solution, allow to stand for several hours (or overnight if possible) and then flush boom and nozzles again and drain the tank. When flushing the boom, open the boom ends to get particles out of the boom.
4. Inspect the inside of the tank for visual residues. Rinse the inside of the tank if necessary. Repeat step 2.
5. Wash the outside of the sprayer with soap or mild detergent and water.
6. Remove nozzles, screens, and wash separately in a bucket containing cleaning solution. Wash out measuring containers with the cleaning solution.
7. Remove all boom end plugs or caps. Product residues collected in the ends of the various boom pipe sections could cause crop injury. Thoroughly clean out the plugs or caps and pipe ends with cleaning solution. Carefully replace all the boom end plugs or caps.

Thoroughly rinse the tank, hoses, booms, nozzles and screens with clean water for a minimum of 10 minutes. Repeat immediately before the next use.

Use household detergent at rate of 250 mL/100 L or 1 kg/150 L of water. Use ammonia (3%) at 1 L/100 L of water. Use other cleaning agents according to label directions. Never mix ammonia with chlorine bleach. Chlorine gas is produced which may cause severe eye, nose, throat, or lung irritation.

**NOTE:** Contact the manufacturer of pesticides being used to determine the best methods and product(s) to clean residue from tanks and associated equipment. Read the label, since many products provide specific tank-cleaning information on their label.

When surfactants or fertilizer solutions (e.g. AGRAL 90, 28% UAN) are used in a recommended mix with herbicides, there may be some inadvertent cleaning of previous residues from the tank/equipment that could affect the crop. Proper cleanout when changing products is essential to prevent crop injury.

The wash water contains herbicide. Never allow wash water to run into a well, lake, pond, river or other water source.

**Do not leave puddles that may be accessible to children, pets, farm animals or wildlife.**

### Sprayer Calibration

#### Field Boom-Type Sprayer Calibration (Determining application rates in L/ha).

There are many ways of determining the rate of spray material that is being applied to 1 ha of land.

## Instructions

1. Measure the time.
  - Place 2 stakes 50 m apart in the field.
  - Select the gear and throttle setting (rpm) at which you plan to spray. Half-fill the sprayer with water.
  - Drive the distance between the stakes three times, timing each pass. Each time, make sure the tractor is at the desired speed as you pass the first stake. Continue driving at this speed until you pass the second stake.
  - Note the average time of the 3 passes.
2. Measure the average nozzle output.
  - Park the sprayer with the PTO engaged and the throttle adjusted to reach the PTO speed set in the test run.
  - Adjust the pressure regulator to the desired working pressure with full flow to the boom.
  - Collect the output from each nozzle for the average length of time needed to travel the 50 m in the test run.
  - Enter the nozzle outputs into the equation below.
  - If any nozzle is more than 5% above or below the average output, it should be cleaned, re-tested and if still 5% off, be replaced.
3. Measure the nozzle spacing in metres.

4. Use the following formula to determine the sprayer output:

$$\text{Sprayer Output} = \frac{\text{Average Nozzle Output (mL)}}{(\text{Litres/hectare})} \times \text{Nozzle spacing (metres)} \times 0.2$$

5. Calculate the area sprayed per full tank of spray solution. Re-check the sprayer calibration after each tank of spray is applied by dividing the volume sprayed by the area sprayed. The nature of some products may slightly alter the calibration from that of clean water.
6. Growers who are more comfortable with litres/acre or gallons/acre can use the following conversion guide.

$$\text{Litres/hectare} \times 0.4 = \text{L/acre}$$

$$\text{Litres/hectare} \times 0.09 = \text{Imp. gal/acre}$$

$$\text{Litres/hectare} \times 0.11 = \text{U.S. gal/acre}$$

### Sample Calculation

Average time to travel 50 m (164 ft) = 24.5 sec

Average amount of liquid collected per nozzle for 24.5 sec = 525 mL

Nozzle spacing on the boom = 0.5 m (> 20 in.)

$$\text{Application rate} = \frac{525 \text{ mL}}{0.5 \text{ m}} \times 0.2 = 210 \text{ L/ha}$$

$$210 \text{ L/ha} \times 0.4 = 84 \text{ L/acre}$$

$$210 \text{ L/ha} \times 0.09 = 18.9 \text{ Imp. gal/acre}$$

$$210 \text{ L/ha} \times 0.11 = 23 \text{ U.S. gal/acre}$$

**Band Spraying:** The same formula can be used to calibrate when banding. Instead of using nozzle spacing in metres, use width of area sprayer per nozzle in metres.

**NOTE 1:** Sprayer-calibration bottles or kits are available from a number of suppliers. For further information contact your local office of the Ontario Ministry of Agriculture, Food and Rural Affairs or manufacturers of sprayers, sprayer parts or herbicides.

**NOTE 2:** For banded-spray applications, measure the width of the spray band (at the soil surface or surface of the crop canopy) and enter this value into the formula instead of the "nozzle spacing". Note that in band spraying the acreage sprayed is **not** the same as the crop acreage. (When broadcast spraying a row crop with 1 m rows, the whole field is treated. A band spray may only treat 30 cm over each row. Therefore, only about 1/3 of the field is actually treated.) The herbicide rates referred to in most herbicide publications and labels refer to the actual area sprayed unless otherwise stated.

## Hand-Held/Backpack Sprayer Calibration

Many people use small hand-held or backpack sprayers for treating problem areas or spraying areas that were missed. Calibration of these sprayers is as important as calibrating your field sprayer.

### Method I

1. Measure an area that is 100 sq. m. e.g., 10 m × 10 m, or 25 m × 4 m
2. Fill the spray tank with water. Mark the level on a measuring stick. Pump to the pressure that will be used during the pesticide application.
3. Spray the water over the 100 sq. m area. Walk at a steady pace, taking care to apply it as evenly as possible, just as you would when applying pesticide.

- Measure the amount of water needed to refill the spray tank to the mark on the measuring stick. This amount will be the sprayer output per 100 sq. m.

#### **Method II**

- Set 2 stakes 50 m (164 ft) apart in the field.
- Half-fill the sprayer with water.
- Walk the 50 m three times at a steady pace. Calculate your average time to travel the 50 m.
- Measure the width of the band sprayed by the nozzle (in metres) at your walking pace.
- Pump the sprayer for the same amount of time as calculated in step #3, collecting the liquid from the nozzle in a measuring device.
- Application rate (L/ha)=  

$$\frac{\text{mL liquid per nozzle}}{\text{Band width (metres)}} \times 0.2$$

#### **Method III**

- Partially fill sprayer. Pump to the pressure you will use during the pesticide application.
- Spray to determine width of swath (in metres).
- Walk at a steady pace for 15 seconds. Measure the distance (in metres).
- Multiply spray width times distance travelled to provide the area (in square metres) sprayed in 15 seconds.
- Spray into a measuring device for 15 seconds – gives amount of solution sprayed in 15 seconds.

$$6. \text{ Application rate (L/ha)} = \frac{\text{amount sprayed}}{\text{area (length} \times \text{width)}} - \frac{\text{L} \times 10,000}{\text{sq. metres}}$$

To convert the application rate of any pesticide to the amount required for a small area, follow this guide:

- 1 kg/ha = 10 grams/100 m<sup>2</sup>
- for liquid measure, 100 L/ha = 1 L/100 m<sup>2</sup>

(Source: Ontario Pesticide Education Program Manual 1995).

## **Determining Amount of Herbicides Needed**

### **Determining Amount of Product per Hectare**

Most rates suggested in this publication are given in terms of both active ingredients (common name) per hectare and product (TRADE NAME) per hectare. However, where the amount of active ingredient in the formulations varies considerably (for example, glyphosate is available in concentrations of 360 g/L, 480 g/L, 500 g/L and 540 g/L) The rate may be given in terms of active ingredient only.

**NOTE:** Throughout the Crop Recommendations sections of this publication, the common name of each herbicide (its active ingredient) is printed in italicized lowercase letters (e.g. atrazine, dicamba), whereas the product trade name (the name of the liquid or powder etc., inside the container as supplied by the manufacturer) is printed in capital letters (e.g. AATREX, BANVEL II), and its formulation is listed within brackets following the trade name.

## **Determining Amount of Product Required per Tankful**

After determining how much commercial product is needed per hectare, calibrate the sprayer and determine the number of hectares each tank will cover. Determine the quantity of herbicide needed to add to the spray tank using the following formula:

Area covered per tankfull =  
sprayer tank size (Litres)/Application Rate (L/ha) =  
hectares

Product required/tank =  
hectares covered by tank × product rate/ha

### **Sample Calculations**

(a) product/tank = 4.1 ha × 2.2 kg/ha  
= 9.02 kg LOROX/tank

(b) product/tank = 4.1 ha × 2.1 L/ha  
= 8.61 L AATREX/tank

Follow manufacturer's recommendations on mixing order and procedures.

## **Materials, Mixing and Mixtures**

Dry herbicide formulations include granules, soluble powders and wettable powders. Granules do not require prior mixing into a slurry. They are ready to be mixed in water. Soluble powders can be dissolved in water. Wettable powders will not dissolve but will form a suspension that requires constant agitation.

Liquid herbicide formulations either mix in water to form a solution or may be oil-based and form an emulsion that will require agitation.

Pesticide labels usually provide mixing directions for registered tank-mixes, often describing the order of mixing. Whenever a label provides mixing directions,

they should be followed. Consult the package labels for information on the compatibility of different herbicide products as certain formulations may react when mixed together, resulting in materials with different properties and activities than the original ones. If the pH or hardness of the water requires adjustment, adjustments should be made prior to the addition of spray material to the tank.

When the label does not provide mixing instructions for a registered tank-mix, pesticides should generally be mixed using the following procedure:

- Fill the spray tank with water to  $\frac{1}{2}$  of the total spray volume required and start agitation. Add the different formulation types in the order listed below, allowing time for complete mixing and dispersion after adding each product.
  1. dissolvable packs
  2. wettable powders
  3. water dispersible granules and dry flowables
- Maintain agitation and fill spray tank to  $\frac{3}{4}$  of total spray volume. Then add:
  4. water-based solutions
  5. emulsifiable concentrates
  6. spray adjuvants
- Finish filling the spray tank to the required volume. Maintain continuous agitation during mixing and final filling, and throughout application.

Mixtures of different herbicides or mixtures of herbicides with pesticides or foliar fertilizers should not be applied in a single application unless registered for use in this way.

Unless specifically mentioned in this publication, or on a herbicide label, the addition of a surfactant or a detergent to a spray solution is not recommended.

Where water is known to have an excessive salt content, compatibility of the water and the chemical at field strength should be tested first on a small scale. See note on *Agitation* in the *Care and Use of Equipment* section, page 14.

### Application Indicators

#### **Colourants/Foam Markers for Pesticides Application**

Colourants added to the pesticide solution help show where pesticides have been applied. Foam marking systems help minimize overlap. Adding a colourant to the basal sprays of herbicides on cut stumps of woody plants helps assure thorough coverage without respraying. Examples of colourants are listed below.

- Blazon: blue, water soluble
- Bas-oil Red : red, oil soluble
- Red Dye Foam

Colourants are available from agricultural chemical dealers.

#### **Pesticide Drift**

Do you know what pesticide drift looks like or what you can do about it? OMAFRA and CropLife Canada have created two short videos with innovative visual demonstrations using dyes and night-spraying to show what drift actually looks like. See how spray particles behave and discover what changes can be made to your spray program to greatly reduce the risk of pesticide drift. Learn more at [www.ontario.ca/spraydrift](http://www.ontario.ca/spraydrift).

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

### 3. USING PESTICIDES IN ONTARIO

This is a generic chapter. Some of the information in this chapter does not apply to herbicide application.

The information in this chapter is updated regularly. For up-to-date information, visit the OMAFRA website at [www.ontario.ca/usingpesticides](http://www.ontario.ca/usingpesticides).

**Read the latest product label before using a pesticide!**

**Review the Grower Pesticide Safety Course Manual.**

**Keep detailed spray records.**

#### Federal Registration of Pesticides

Before a pesticide can be sold or used in Ontario, it must be registered under the federal *Pest Control Products Act* (PCP Act) and be classified under the provincial *Pesticides Act*. The Pest Management Regulatory Agency (PMRA) of Health Canada registers pesticides for use in Canada following an evaluation of scientific data to ensure that the product has merit and value. It also ensures that the human health and environmental risks associated with its proposed use are acceptable.

The PMRA re-evaluates registered pesticides to determine whether today's health and environmental protection standards are still met when following the label directions. Outcomes of a re-evaluation can be:

- no change in the registration
- label amendments (i.e., changes to personal protective equipment requirements, restricted entry intervals and buffer zones)
- modifications to existing maximum residue limits (MRLs)
- elimination or phasing-out of certain uses or formulations
- no further acceptance of the registration

**The pesticide label is a legal document.** It prescribes how the pesticide can be legally used. Off-label use is prohibited. It is against the law to use the pesticide in any other way or on any other crop or pest than as specified on the label. Labels for all registered pesticides are under Search Pesticide Labels on the PMRA website at [bit.ly/herbicidelabels](http://bit.ly/herbicidelabels). Ensure you have the most current label and are aware of any re-evaluation decisions.

#### Regulation of Pesticides in Ontario

The Ministry of the Environment (MOE) is responsible for regulating the sale, use, transportation, storage and disposal of pesticides in Ontario. Ontario regulates pesticides by placing appropriate education, licensing and/or permit requirements on their use, under the *Pesticides Act* and Regulation 63/09. All pesticides must be used in accordance with requirements under the *Pesticides Act* and Regulation 63/09, which are available on the e-laws website at [www.e-laws.gov.on.ca](http://www.e-laws.gov.on.ca) or by calling Service Ontario at 1-800-668-9938 or 416-326-5300.

#### Classification of Pesticides

Before a federally registered pesticide can be sold or used in Ontario, it must be classified under the provincial *Pesticides Act*. The Ontario pesticide classification system consists of 11 classes. The Ontario Pesticides Advisory Committee (OPAC) is responsible for reviewing and recommending to the MOE the classification of pesticide products. Pesticide products are classified on the basis of their toxicity, environmental or health hazard, persistence of the active ingredient or its metabolites, concentration, usage, federal class and registration status. This classification system provides the basis for regulating the distribution, availability and use of pesticide products in Ontario. Once approved by the MOE, classified products are posted on the MOE website at [www.ontario.ca/environment](http://www.ontario.ca/environment).

#### Certification and Licensing

##### Growers and Their Assistants

Growers must be certified through the Grower Pesticide Safety Course in order to buy and use Class 2 and 3 pesticides on their farms. They do not require this certification to use Class 4, 5, 6 or 7 pesticides. For information about certification for growers and training for assistants to growers, visit the Ontario Pesticide Education Program website at [www.opep.ca](http://www.opep.ca) or call 1-800-652-8573.

##### Commercial Applicators (Exterminators) and Their Assisting Technicians

For more information about exterminator licensing and technician training, visit the Ontario

Pesticide Training and Certification website at [www.ontariopesticide.com/index.cfm/home-page](http://www.ontariopesticide.com/index.cfm/home-page) or call 1-888-620-9999 or 519-674-1575.

## Pesticide Application Information

When you decide to use a pesticide, choose the most appropriate formulation and application method for your situation. Use only a properly calibrated sprayer. Choose less toxic alternatives when possible. Take all possible precautions to prevent the exposure of people and non-target organisms to the pesticide. Read the most current pesticide label thoroughly before application. The label provides important information, such as:

- directions for use (rates of application, crops it can be used on, target pests, crop rotation restrictions, total number of applications, droplet size/nozzle

type, application equipment, timing and ideal weather conditions)

- required personal protective equipment (PPE)
- hazard symbols and warnings
- restricted entry intervals
- buffer zones
- precautionary statements
- steps to be taken in case of an accident
- disposal

For more information on hazards, consult the Material Safety Data Sheet (MSDS) or contact the manufacturer.

**For more information on pesticide application, see:**

- OMAFRA Factsheet *Pesticide Contamination of Farm Water Supplies – Recommendations on Avoidance, Cleanup and Responsibilities*, Order No. 10-097

### Restricted Entry Intervals

The restricted entry interval, also referred to as Re-Entry Interval (REI), is the period of time following a pesticide application during which workers

must not enter the treatment area. This allows any pesticide residue and vapours to dissipate from the treatment location (e.g., field), preventing the possibility of inadvertent pesticide exposure.

The PMRA reviews each pesticide to determine whether the label should include a specific restricted entry interval. If the restricted entry interval is not stated on the label for agricultural crops assume that the REI is 12 hours. For golf courses and other residential turf, the spray solution must be dry before entry can occur. Some pesticides have labels that carry a warning about working in treated crops and provide specific PPE requirements. Follow the label recommendations.

### Days to Harvest for Food Crops (Pre-Harvest Intervals, Pregrazing and Feeding Intervals)

These intervals state the minimum time that must pass between the last pesticide application and the harvesting of the crop, or the grazing or cutting of the crop for livestock feed. If you harvest a crop before the pre-harvest interval (PHI) has passed, there may be pesticide residues in excess of the maximum residue limits (MRLs) set by PMRA.

“Up to the day of harvest” means the same as 0 days PHI; however, the REI may be more restrictive (i.e., a 12-hr restricted entry interval) and must be observed for harvesting that occurs on the day of application.

**To avoid exceeding the maximum residue limits, always follow the directions on the label.**

### Buffer Zones

Buffer zones, or no spray areas, are areas left untreated to protect an adjacent sensitive area, such as sensitive terrestrial and aquatic habitats. Generally, a buffer zone is the downwind distance separating the point of

direct pesticide application from the nearest boundary of a sensitive habitat.

Leave a suitable buffer zone between the treatment area and adjacent sensitive areas. Buffer zones may vary depending on the method of application (i.e., aerial, field boom, air blast). Check the pesticide labels for buffer zone requirements.

**Sensitive terrestrial habitats** include hedgerows, grasslands, shelterbelts, windbreaks, forested areas and woodlots.

**Sensitive freshwater habitats** include lakes, rivers, streams, creeks, reservoirs, marshes, wetlands and ponds.

Health Canada's Pest Management Regulatory Agency has an online spray drift calculator that allows applicators to modify the buffer zones specified on the product label, based on weather conditions, the category of sprayer or droplet size. For more information, see the Buffer Zone Calculator at [www.b-e-st.gc.ca/cps-spc/pest/agri-commerce/drift-drive/calculator-calculatrice-eng.php](http://www.b-e-st.gc.ca/cps-spc/pest/agri-commerce/drift-drive/calculator-calculatrice-eng.php).

#### **Setback Distances for Water Bodies**

It is an offence under the federal *Fisheries Act* to introduce into water any material that may be harmful to fish or fish habitat. To protect these waters, applicators must determine a suitable setback distance between the area to be protected and the area where pesticide treatments are planned (if one is not specified on the pesticide label). The protected area includes the water body as well as adjacent riparian (riverbank) areas that contribute to fish food and habitat.

## **Protect the Environment**

### **Protect Water Sources**

According to the British Crop Protection Council (BCPC), 40–70% of surface water pesticide contamination comes from mixing and filling areas.

Where possible, load or mix pesticides on impermeable surfaces that are safely away from watercourses or environmentally sensitive areas. Collect drainage and run-off and dispose of it safely (*Your Guide to Using Pesticides*, BCPC 2007).

Clean your spray equipment away from wells, ponds, streams and ditches. Apply the diluted rinse water (usually at a ratio of 10:1) to the treatment area (crop) but do not exceed the pesticide rate recommended on the label.

Do not make a direct connection between any water supply (e.g., public supply, wells, watercourse or pond) and a spray tank. Use an anti-backflow device or intermediate system to prevent back-siphoning that could contaminate the water supply.

Immediately contain and clean up any spills to prevent contamination to water sources.

Check the pesticide label for specific instructions on water source protection.

### **For more information on protecting water sources, see:**

- OMAFRA Factsheet *Pesticide Contamination of Farm Water Supplies – Recommendations on Avoidance, Cleanup and Responsibilities*, Order No. 10-097
- OMAFRA Factsheet *Groundwater – An Important Rural Resource: Protecting the Quality of Groundwater Supplies*, Order No. 06-115
- OMAFRA/Agriculture and Agri-Food Canada booklet *Best Management Practices – Pesticide Storage, Handling and Application*, Order No. BMP13

### **Bee Poisoning**

Honey bees, native bee species and other pollinating insects are important pollinators for many Ontario crops. Insecticides, some of which may negatively affect bees, are required for insect control but with careful management, both pollination and insect control can be achieved. Growers and licensed commercial exterminators can protect bees by following these suggestions:

- Before applying a pesticide, advise local beekeepers so they can move colonies out of the danger area. Contact the Provincial Apiarist at 1-888-466-2372, ext. 63595, for a list of the beekeepers in the area or see [www.ontario.ca/crops](http://www.ontario.ca/crops) and click "Apiculture" for a list of provincial bee inspectors who know the local beekeepers.
- Do not apply insecticides while fruit trees are in bloom. The *Bees Act* makes it an offence to do so in Ontario. Do not spray any flowering crop on which bees are foraging and read the pesticide label for guidelines.
- Time insecticide applications to minimize bee poisoning. Daytime treatments, when bees are foraging, are most hazardous. Insecticide applications

in the evening are the safest. Spraying after 8 PM allows the spray to dry before the bees are exposed to it the next day. This is the most successful way to avoid bee damage. Early morning is the next best time, but spraying should be completed before 7 AM. While honeybees and most other pollinating insects do not usually forage at temperatures below 13°C, bumblebees do. If you plan to spray in the morning, contact beekeepers who have bees within 10 km of your crop. The beekeepers will then have the option of taking protective action.

- Beekeepers can place wet bags in the entrance of the hive to disrupt the flight of the bees for up to 12 hr and provide more time for spray to dry. An opening of 2.5 cm on each side of the hive entrance is necessary so the bees can get out and ventilate the hive.
- Beekeepers should remove honeybee colonies as soon as pollination is complete and before any postbloom insecticides are applied.
- Honeybees may be poisoned by visiting weeds or cover crops, such as dandelions or clovers that are in bloom in the orchard or field. Avoid spray drift to blooming plants that are adjacent to the target field. Where possible, mow down such crops prior to a spray to help safeguard the bees.
- Do not apply insecticide on windy days to prevent drift toward nearby hives.
- If there is a risk of honeybee poisoning, try to choose an insecticide that is not highly toxic to the bees. When there is a choice, choose a product formulation that is less hazardous to bees. EC formulations are usually less toxic than WP formulations.

### Manage Drift

Pesticide drift is the aerial movement and unintentional deposit of pesticide outside the target area. Drift results in wasted product and compromised crop protection, and can adversely affect nearby sensitive environmental areas, crops and wildlife. The following strategies can help reduce the risk of pesticide drift:

- Do not spray when wind speeds are high or gusty. These conditions increase the potential for spray drift. Check pesticide labels for allowable wind speeds for spraying applications. Some labels may not provide this specific information. Constantly monitor wind conditions during spraying, using a good quality wind meter. Record the wind speed and direction. As wind conditions change, you may need to make adjustments to further reduce the drift potential, such as adjusting water volume upwards, minimizing nozzle-to-target distance, changing nozzle technology, changing fields because of surrounding influences or stopping spraying until conditions improve.
- Do not spray during periods of dead calm. Periods of dead calm may occur in early morning or late evening, at which time the temperature is usually cooler and the relative humidity is typically higher and can result in the spray droplets remaining aloft, like fog. When the wind picks up, these spray droplets can move away from the target area, possibly causing injury to adjacent non-target areas.
- Use the recommended sprayer output.
- Use a nozzle that will produce the appropriate droplet size if specified on the pesticide label. Nozzles that produce fine droplets are rarely, if ever, required.

- Use the most appropriate nozzle for the type of application. Where practical, use air induction/ venturi nozzles, which significantly reduce drift when compared to conventional nozzles.
- Check the height of the boom to the target, or distance from airblast boom to the target, and minimize the distance as much as possible while still maintaining spray uniformity.
- Follow buffer zone requirements for the protection of adjacent sensitive areas as outlined on the pesticide label.
- Use spray plume protection where practical or available (hoods, shrouds, screens and air curtains).
- Use drift-reducing adjuvants in the spray tank as directed on the label. Sprayer agitators (e.g., paddle or hydraulic return) have been shown to reduce the effectiveness of certain drift-reducing adjuvants.
- Use wick weeders instead of spraying when possible.
- Use non-volatile pesticide formulations or products when possible.

#### For more information about spray drift, see:

- OMAFRA Factsheet *Pesticide Drift from Ground Applications*, Order No. 11-001
- OMAFRA/Agriculture and Agri-Food Canada booklet *Best Management Practices – Pesticide Storage, Handling and Application*, Order No. BMP13
- Ontario Pesticide Education Program (University of Guelph, Ridgetown Campus) videos *How to Manage Spray Drift and Spray Drift Reduction Through Air Induction*, available at [www.opec.ca/index.cfm/learning-resources/videos/chapter-19-drift-of-pesticides/](http://www.opec.ca/index.cfm/learning-resources/videos/chapter-19-drift-of-pesticides/)

## Pesticide Disposal

### Empty Pesticide Containers (up to 23 L)

Never re-use empty containers.

The Ontario Empty Pesticide Container Recycling Program is available free of charge to growers and commercial applicators. Through this program, you can return triple-rinsed or pressure-rinsed plastic pesticide containers (up to 23 L) to pesticide container collection depots located throughout the province. Remove the cap and booklet from the pesticide container before recycling. To locate the closest pesticide container collection depot, visit the CleanFARMSTM website at [www.cleanfarms.ca](http://www.cleanfarms.ca), call your local dealer or call CleanFARMSTM at 416-622-4460.

### Empty Pesticide Containers (greater than 23 L)

Growers and commercial applicators can return expired pesticide containers that are greater than 23 L in size. Contact your local dealer for details on disposal of these containers or call CleanFARMSTM at 416-622-4460.

### Surplus Spray Mix

The best approach to disposing of surplus spray mix is to avoid creating it by planning the spray job accurately.

When this is unavoidable, dispose of excess spray mix by spraying it on other crops that require an application of this pesticide. Before spraying, check the label to make sure the pesticide is registered for use on that other crop.

If you cannot find another crop to spray, dilute the remaining spray mix by adding 10 parts of water for each 1 part of spray mix. The diluted solution can be safely applied to the original treated area as long as

you do not exceed the pesticide rate recommended on the label. Be sure to check the label for any restrictions about crop rotation, days to harvest or surplus spray mix disposal.

Never re-spray the treated field with undiluted spray mix. Spraying an area twice will double the recommended pesticide rate. This may cause illegal pesticide residues in the harvested crop or harmful residues in the soil that can cause crop damage.

### Surplus Pesticides In Storage

Be sure to safely dispose of pesticides that you do not need or cannot use. Options for proper disposal include:

- Contact the supplier. It is sometimes possible to return unused pesticide if it is still in its original, unopened container.
- Hire a waste hauler who is licensed under Part V of the *Environmental Protection Act* to carry hazardous wastes. Look in the Yellow Pages of your telephone directory under Liquid Waste Removal.
- Check your local paper or visit the CleanFARMSTM website ([www.cleanfarms.ca](http://www.cleanfarms.ca)) for upcoming Obsolete Pesticide Collection Days.
- Contact your municipality to see if any waste collection days are scheduled and verify whether quantities of agricultural pesticides will be accepted.

### Storing Pesticides

Ontario's *Pesticides Act* and Regulation 63/09 provide details on storage requirements for pesticide storage facilities. The storage requirements that must be followed are dependent on which classes of pesticides you store.

**TABLE 3-1. Storage Requirements for Pesticide Storage Facilities**

Storage Requirements	Pesticide Classes			
	Class 2	Class 3	Class 4, 5 & 7	Class 6
No contact with food or drink	✓	✓	✓	✓
Not an impairment to health and safety	✓	✓	✓	
Clean and orderly	✓	✓	✓	
Warning sign G posted*	✓	✓	✓	
Emergency telephone numbers posted**	✓	✓	✓	
Vented to outside	✓	✓		
Limited access (locked)	✓	✓		
No floor drain	✓	✓		
Respiratory protection and protective clothing kept readily available	✓	✓		
Area used primarily for pesticides	✓			

Note: Sufficient precautions are needed in your storage area to prevent the pesticide from entering the natural environment. Ensure your floor drain does not enter the natural environment.

\* Refer to MOE's website [www.ene.gov.on.ca/en/land/pesticides](http://www.ene.gov.on.ca/en/land/pesticides) for requirements for warning sign G. These signs can be purchased from your pesticide dealer/vendor.

\*\* Emergency contact numbers must include telephone numbers for the local fire department, hospital and poison control centre. The number for the MOE Spills Action Centre (1-800-268-6060) should also be readily available.

For pesticide poisonings and pesticide injuries, call:

**Poison Information Centre:**

**1-800-268-9017**

**(TTY) 1-877-750-2233**

For more information, see inside back cover on Emergency and First Aid Procedures for Pesticide Poisoning.

**For more information about storing pesticides, see:**

- OMAFRA Factsheet, *Farm Pesticide Storage Facility*, Order No. 11-005
- OMAFRA/Agriculture and Agri-Food Canada booklet *Best Management Practices – Pesticide Storage, Handling and Application*, Order No. BMP13

## Pesticide Spills

If a pesticide spill causes, or is likely to cause, an adverse effect that is greater than that which would result from the proper use of the pesticide, you must notify the Ministry of the Environment Spills Action Centre at 1-800-268-6060 (24 hours a day, 7 days a week) and your municipality.

A spill is defined as a discharge of pollutant that is abnormal in quality or quantity, from or out of a structure, vehicle or other container into the environment. An incident such as an overturned pesticide sprayer that results in the loss of the spray solution to the environment is an example

of a spill. A pesticide container that ruptures and leaks its contents is another example of a spill. The discharge or spraying of a pesticide in an unapproved area, commonly referred to as an overspray, is also considered a spill.

Before you begin to clean up a spill of any nature, remember to protect yourself against pesticide exposure. Wear the proper protective clothing and personal protective equipment. If the spill occurs inside an enclosed area (e.g. a pesticide storage area or a vehicle during transport), ventilate the area first. Once you have protected and/or removed yourself and other persons or animals from the spill site, take additional measures to stop the spill at the source and prevent it from spreading and/or contaminating watercourses. Specific precautions, emergency contact information and first aid procedures may be found on the label.

For minor spills, it may be possible to remediate the problem:

- **For a liquid spill** – Cover the spill with a thick layer of absorbent material such as kitty litter, vermiculite or dry soil. Sweep or shovel the material into a waste drum and dispose of the contents as you would a hazardous waste.

- **For a dust, granular or powder spill** – Sweep or shovel the material into a waste drum and dispose of the contents as you would a hazardous waste.

For major spills, it is essential to stop the spill from spreading. The clean-up guidelines above may not be appropriate for all spill situations. Once you have contained the spill, follow directions from the manufacturer and regulatory authorities on cleaning the contaminated area.

**For information on preventing spills, see:**

- OMAFRA Factsheet, *Ways to Avoid Pesticide Spills*, Order No. 96-025
- OMAFRA/Agriculture and Agri-Food Canada booklet *Best Management Practices – Pesticide Storage, Handling and Application*, Order No. BMP13
- Ontario Pesticide Education Program (University of Guelph, Ridgetown Campus) Grower Pesticide Safety Course Manual, available at [www.opec.ca](http://www.opec.ca). Select Learning

**redroot pigweed**

**common ragweed**

**spreading atriplex**

**lamb's-quarters**

**green foxtail**

**eastern black nightshade**

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

## 4. HERBICIDES USED IN ONTARIO

Herbicide Trade Names are listed alphabetically with the active ingredient in parenthesis. Refer to the active ingredient name in Table 4-1. *Herbicides Used in Ontario*, page 29, and the *Notes on Herbicides*, page 38, proceeding Table 4-1 for more information about a specific Trade Name:

<b>1</b>	2,4-D AMINE 500 (2,4-D)	<b>36</b>	CALIBER 625 (2,4-DB)	<b>71</b>	ELIM EP (rimsulfuron)

**TABLE 4-1. Herbicides Used in Ontario (cont'd)****Footnotes**

Mention of a brand or trade name in this table does not constitute a guarantee or warranty of the product. Always refer to the product label before using.

**<sup>1</sup>Formulation Abbreviations**

DC	= dispersible concentrate	F	= flowable	OD	= oil dispersible	Sn	= solution
DF	= dry flowable	Gi	= gel	PE	= pellets	SP	= soluble powder
DG	= dry granules	Gr	= granular	PS	= pressurized spray	Su	= suspension (flowable)
DS	= dry soluble	Li	= liquid	SC	= soluble concentrate	WG	= wettable granules
EC	= emulsifiable concentrate	ME	= microencapsulated suspension	SG	= soluble granules	WP	= wettable powder
EM	= emulsion					WDG	= wettable dry granules

<sup>2</sup> The amount of active ingredient guaranteed to be in the unit of formulated herbicide and expressed as grams active ingredient per litre of product or the percentage of active ingredient per mass of product.

<sup>3</sup> Indicates the numeric grouping of herbicides by their site of action and by the Weed Science Society of America (WSSA). Herbicide resistant weeds have historically been selected when herbicides with the same site of action are used repeatedly. Refer to Table 4-6. *Weed Populations Confirmed Resistant to Herbicide Groups in Ontario Counties*, page 74, for a listing of herbicide resistant weeds in Ontario by WSSA group and corresponding site of action.

<sup>4</sup> The product registration number for this trade name under the *Pesticide Control Product Act*, commonly referred to as a "PCP number". The PCP number has been placed in the guide for convenience, but the pesticide label in possession should always be used for the most accurate and current PCP number.

<sup>5</sup> Refers to the registrant of the herbicide. See Appendix G. *Herbicide Companies and Agents*, page 397. Phone numbers and websites are also listed.

<sup>6</sup> Refers to the numeric classification of pesticides under Regulation 63/09 of the *Pesticides Act*. Refer to Table 4-2. *Description for Ontario Classification of Pesticide Products*, on this page, for a description of each Ontario classification.

<sup>7</sup> Indicates herbicides sold as a co-pack under this trade name.

---

**TABLE 4-2. Description for Ontario Classification of Pesticide Products**

Ontario Classification	Summary*
1	Designated under the <i>Pesticide Control Product Act</i> (PCPA) as pesticides of the Manufacturing Class for use only in the manufacture of a pest control product or a product regulated under the <i>Fertilizers Act</i> .
2,3,4	Designated under the PCPA as pesticides of the Commercial Class for use in commercial activities that are specified on the label or Restricted Class when the label specifies essential conditions respecting the display, distribution or limitations on the use of, or qualifications of persons who may use the product.
5,6,7	Designated under the PCPA as pesticides of the Domestic Class to be distributed primarily to the general public for personal use in or around their homes.
8	Banned for sale in Ontario.
9	Banned for use in, on or over land unless their use is excepted.
10	Are allowed for use under the promotion of public health or safety exception.
11	Require a "green" notice sign be posted for the purposes of providing public notice when products containing these ingredients are used by any person on non-residential area land and by a licensed exterminator on residential area land in performing land extermintations.

\* Detailed descriptions of each classification can be found at: <http://www.ene.gov.on.ca/en/land/pesticides/class-pesticides.php>.

## Notes on Herbicides

Read these notes together with the information provided in other chapters throughout this publication. Additional information on use, toxicity and safety precautions is given here. Herbicides are listed by their common (chemical) name rather than their trade (product) name. See Table 4-1, *Herbicides Used in Ontario*, page 29, to determine the corresponding common name for a particular trade name. For example, Table 4-1 indicates that the trade name AATREX has a common name of atrazine; notes on AATREX are listed under atrazine in this section. See Chapter 5, *Notes on Adjuvants*, page 77, for information on adjuvants.

Complete information on each herbicide is available on the product label located on the herbicide container. The federal Pest Management Regulatory Agency also lists pesticide labels on their website [bit.ly/herbicidelabels](http://bit.ly/herbicidelabels). Many herbicide manufacturers also list product labels and/or Material Safety Data Sheets (MSDS) on their websites listed on the last page of this publication.

### 2,4-D

**Trade Names:** 2,4-D AMINE 500, 2,4-D ESTER 600, 2,4-D ESTER 600, 2,4-D ESTER 700.

**Chemical Family:** Phenoxy.

**Crop and/or Non-Crop Registrations:** Cereals, turf, pastures, non-cropland, asparagus, field corn, cranberries, raspberries, strawberries, bearing fruit trees including apple, pear, peach, plum, apricot and cherries, potato (preharvest) and brush.

**Sensitive Weeds:** annual sow-thistle, bluebur, cocklebur, daisy fleabane, false flax, flixweed, goat's beard, kochia, lamb's-quarters, mustards, plantain, prickly lettuce, ragweeds, redroot pigweed, Russian pigweed, Russian thistle, shepherd's purse, stinging nettle, stinkweed, sweet clover, wild radish and wild sunflower, A number

of other broadleaf and woody species are listed as less susceptible or for top growth control only.

**Uptake and Translocation:** Readily absorbed through leaves or roots. Translocated primarily in phloem with the sugars but can also move with water in the xylem. Accumulation is primarily in the young, rapidly growing meristematic regions of roots or shoots.

**Basis of Selectivity:** Differences in interception, penetration, translocation, metabolism and sensitivity of active sites lead to greater activity on broadleaf weeds compared to grasses.

**Application Methods:** Postemergence (broadleaf weeds), stem-foliage or stem-basal (brush).

**Residual Activity:** Half-life in soil is usually not longer than 1 or 2 weeks during the growing season due to rapid decomposition by soil micro-organisms.

**Unique Characteristics:** All weeds are more easily killed when growing rapidly in moist soil. Unfortunately, some broadleaf crops, garden and ornamental plants are as sensitive to 2,4-D as many weeds and only a trace of the chemical as spray drift, vapour drift or contaminant in soil or water may cause serious damage. Even crops that can be sprayed safely can be sensitive at some stages of growth or at excessive application rates; thus follow label precautions carefully. Amines and esters are the most common formulations of 2,4-D. The esters are the most active and can be used at the lower rates and for brush control. Since vapour drift is a potential problem with the ester formulations, use only amines on lawns, or near gardens or susceptible crop areas. Low volatile esters can be used by agriculturists or licensed applicators in areas where risk of damage to sensitive non-target vegetation is low. Recommendations are on the basis of acid equivalent; commercial products differ in their content of acid equivalent, which must be considered in determining the amount of product to use.

### 2,4-D/DICAMBA/MECOPROP-P

**Trade Names:** KILLEX 500, PAR III, PREMIUM 3-WAY XP, TRI-KIL, TRILLION-P LIQUID TURF HERBICIDE, WEEDAWAY XP TURF HERBICIDE.

**Chemical Family:** Phenoxy/benzoic acid/phenoxy.

**Crop and/or Non-Crop Registrations:** Turf.

**Sensitive Weeds:** At field-crop rates: wild buckwheat, lady's-thumb, green smartweed, Russian thistle, sow-thistle, hedge bindweed, corn spurry, knotweed, volunteer cultivated buckwheat, common ragweed, cocklebur, stinkweed, mustards, prostrate pigweed, redroot pigweed and lamb's-quarters. At non-cropland rates, a wide range of broadleaf weeds including bull thistle, chicory, goat's beard, ragwort, white cockle, poison-ivy, alder and sheep-laurel.

**Application Method:** Postemergence when weeds are small and actively growing.

**Unique Characteristics:** This mixture controls a wider spectrum of weeds than any of the herbicides alone.

### 2,4-DB

**Trade Names:** COBUTOX, EMBUTOX, CALIBER.

**Chemical Family:** Phenoxy.

**Crop and/or Non-Crop Registrations:** Seedling alfalfa, bird's-foot trefoil, clovers (except sweet) direct seeded or underseeded in spring wheat, barley or oats; corn.

**Sensitive Weeds:** Many small broadleaf weeds such as stinkweed, ragweed, lamb's-quarters, wild buckwheat and mustards. Top-growth control of Canada thistle, field bindweed and perennial sow-thistle.

**Uptake and Translocation:** Absorbed through the foliage and readily translocated to the growing points.

**Basis of Selectivity:** Sensitive weeds rapidly convert 2,4-DB into 2,4-D; tolerant species do not make this conversion under normal conditions.

**Application Method:** Postemergence.

**Residual Activity:** None.

**Unique Characteristics:** Mustards are not usually controlled by 2,4-DB alone if sprayed beyond the 4 leaf stage; a tank-mixture with MCPA will improve control of these larger mustards. Injury to alfalfa increases under drought stress or when alfalfa seedlings have more than 4 trifoliate leaves.

## ACETIC ACID

**Trade Name:** EOCLEAR, MUNGER  
HORTICULTURAL VINEGAR PLUS.

**Chemical Family:** Not assigned.

**Crop and/or Non-Crop Registrations:** Non-crop, right-of-way and industrial land sites.

**Sensitive Weeds:** Annual broadleaf and grassy weeds including ragweed, chickweed, lamb's-quarters and black medic. Suppression of perennial weeds including dandelion, plantain spp., clover spp., wild carrot, toadflax, quackgrass, tufted vetch, hawkweed spp. and curled dock.

**Basis of Selectivity:** Non selective.

**Application Methods:** Postemergence spray when weeds are small and actively growing. EcoClear is a contact herbicide, thorough coverage is necessary to achieve desirable control. EcoClear can be used as a spot treatment or as a broadcast application. For broadcast application apply 750–1,250 L of final solution/ha.

**Residual Activity:** Non-residual.

**Unique Characteristics:** EOCLEAR works very quickly. Complete control can be achieved in as little as 24 hours. Weeds that are mature, dormant or hardened due to moisture stress tend to be more tolerant to treatment with EOCLEAR.

## ACIFLUORFEN

**Trade Name:** BLAZER.

**Chemical Family:** Diphenyl ether.

**Crop and/or Non-Crop Registrations:** Soybeans.

NOTES ON HERBICIDES: ACETIC ACID

**Sensitive Weeds:** Annual broadleaf weeds including: cocklebur, jimsonweed, lady's-thumb, lamb's-quarters, wild mustard, redroot pigweed, common ragweed and eastern black nightshade. Suppression of perennial weeds including: Canada thistle, hedge bindweed, field bindweed and common milkweed.

**Uptake and Translocation:** Taken up through the foliage. Not readily translocated.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Postemergence when weeds are small and actively growing. Apply in 200–400 L/ha of water with a pressure of 275–400 kPa. Soybeans are tolerant after the first trifoliate-leaf stage. Thorough coverage is necessary. The use of flat fan nozzles is recommended. Do not add adjuvants to acifluorfen applied at the full rate. BASAGRAN may be tank-mixed with acifluorfen for control of additional broadleaf weeds including velvetleaf. When tank-mixing BASAGRAN and acifluorfen, it is recommended to add 1 L/ha of ASSIST OIL CONCENTRATE.

**Residual Activity:** Essentially none.

**Unique Characteristics:** Acifluorfen is not volatile. Significant crop injury can be expected if acifluorfen is applied during hot, humid weather or if the crop is stressed due to previous herbicide injury, flooding, drought or cold conditions prior to the application. Cool weather or drought may delay control. Rainfall within 6 hours after application may reduce effectiveness. Since there is no residual activity, a new flush of weeds may emerge after the first flush has been controlled.

## ACROLEIN

**For More Information:** Visit [www.bit.ly/magnacide](http://www.bit.ly/magnacide).

## ADJUVANT

See Chapter 5, *Notes on Adjuvants*, page 77.

## AMINOPYRALID

**Trade Name:** MILESTONE HERBICIDE.

**Chemical Family:** Pyridine.

**Crop and/or Non-Crop Registrations:** Rangeland, grass pastures, industrial and other non-crop areas of Canada.

**Sensitive Weeds:** MILESTONE used alone controls: Canada thistle, spotted knapweed, Canada goldenrod, scentless chamomile, absinth wormwood, common tansy. MILESTONE can be tank mixed with 2,4-D amine for control of western snowberry, dandelion, annual sow-thistle, bluebur, bull thistle, burdock, buttercup, cocklebur, common plantain, curled dock, flixweed, goat's beard, hawkweed, hoary cress, peppergrass, perennial sow-thistle, prickly lettuce, stinging nettle, sweet clover and wild carrot.

**Uptake and Translocation:** Herbicide taken up primarily through the foliage, but also has soil residual activity on roots, seedlings and seeds. Strong translocation.

**Basis of Selectivity:** Metabolized by tolerant species.

**Application Methods:** Postemergence when weeds are small and actively growing. Apply with ground equipment in minimum of 100 L/ha or aerial equipment in a minimum of 19 L/ha spray volumes. Good coverage is necessary.

**Residual Activity:** Short term soil residual activity that will control most species for two years.

**Unique Characteristics:** MILESTONE has no grazing restriction on livestock or lactating dairy animals grazing in treated areas. Allow 3 days of grazing on untreated pasture or untreated hay before transferring livestock to areas where sensitive broadleaf crops may be grown. Do not move manure compost containing MILESTONE onto sensitive crops, flowers, gardens, etc. Use only on well established forage grasses (secondary root development). MILESTONE Herbicide will kill legume plants including alfalfa and clover in tame pastures. Use adequate buffer zones from

sensitive crops and do not allow product spray to drift off site onto sensitive crops. Do not plant legumes crops on treated land for 48 months after application. Clean spray equipment thoroughly after use, before using spray equipment for other applications to sensitive crops. MILESTONE Herbicide cannot be applied on domestic or commercial turf grass. Rainfast period is 2 hours.

## AMINOPYRALID/METSULURON-METHYL

**Trade Name:** CLEARVIEW HERBICIDE.

**Chemical Family:** Pyridine and sulfonylurea.

**Crop and/or Non-Crop Registrations:** Rangeland, permanent pastures, rights-of way, industrial and other non-crop areas of Canada.

**Sensitive Weeds (135 g/ha):** Ball mustard, bluebur, Canada fleabane, Canada thistle, chickweed, clover, common groundsel, common ragweed, common tansy, corn spurry, cow cockle, dandelion, field scabious, flixweed, green smartweed, hempnettle, horsetettle, kochia, lady's thumb, musk or nodding thistle, narrow-leaved hawkbeard, ox-eye daisy, perennial sow-thistle, plumeless thistle, prostrate pigweed, Russian thistle, scentless chamomile, shepherd's purse, spotted knapweed, stinkweed, stork's bill, sweet clover, tall buttercup, tartary buckwheat, volunteer canola, western snowberry, wild mustard, yellow starthistle.

**Uptake and Translocation:** Herbicide taken up primarily through the foliage, but also has soil residual activity on roots, seedlings and seeds. Strong translocation.

**Basis of Selectivity:** Metabolized by tolerant species.

**Application Methods:** Postemergence when weeds are actively growing. Apply with ground equipment in minimum of 110 L/ha or aerial equipment in a minimum of 30 L/ha spray volumes. Good coverage is necessary.

**Residual Activity:** Short term soil residual activity that will control most species for two years.

**Unique Characteristics:** There is no restriction on livestock or lactating dairy animals grazing in treated areas. Allow 3 days of grazing on untreated pasture or untreated hay before transferring livestock to areas where sensitive broadleaf crops may be grown. Do not move manure compost containing CLEARVIEW onto sensitive crops, flowers, gardens, etc. Use only on well established forage grasses (secondary root development). CLEARVIEW Herbicide will kill legume plants including alfalfa and clover in tame pastures. Use adequate buffer zones from sensitive crops and do not allow product spray to drift off site onto sensitive crops. Do not plant legumes crops on treated land for 48 months after application. Clean spray equipment thoroughly after use, before using spray equipment for other applications to sensitive crops. CLEARVIEW Herbicide cannot be applied on domestic or commercial turf grass. Rainfast period is 2 hours.

## AMITROLE

**Trade Name:** AMITROL 240.

**Chemical Family:** Triazole.

**Crop and/or Non-Crop Registrations:** Preplant in wheat, barley, canola, field peas, corn, soybeans and white beans. Postharvest after any crop. In-season weed control in apples. Use in shelterbelts, non-crop areas, marshes and ditches. Spot treatment in pastures.

**Sensitive Weeds:** Many annual and perennial broadleaf weeds and grasses including quackgrass, dandelions, Canada thistle, sow-thistle, poison-ivy, poison-oak, toadflax, milkweed, hoary cress, leafy spurge, horsetail, cattail, honeysuckle, locust, ash and sumac.

**Uptake and Translocation:** Absorbed by foliage and roots. Translocates well in xylem and phloem. Accumulates in growing regions of plant.

**Basis of Selectivity:** Resistant plants metabolize amitrole more rapidly than sensitive plants and

may have lower uptake as a result of leaf structure that reduces wetting and penetration.

**Application Methods:** Foliar postemergence application to actively growing plants. Good coverage is essential. If weeds are mature, it is advisable to cut them and then spray the regrowth. Do not disturb treated plants for at least 2 weeks after application. Do not make postharvest application after Oct. 1. For control of quackgrass and Canada thistle, apply in spring or fall to actively growing plants 15–20 cm tall; wait 10–14 days and then plough or disk.

**Residual Activity:** Approximately 2–4 weeks in moist, warm soil.

**Unique Characteristics:** Most crops are sensitive if contacted. Poor results may occur if spray coverage is inadequate, if plants are drought stressed or overmature, or if heavy rains fall within 6 hours after application. Do not graze or plant to grain, peas, alfalfa or clover for 8 months after treatment. Do not graze spot-treated areas in pastures for 6 months following treatment.

## ATRAZINE

**Trade Names:** AATREX LIQUID 480, CONVERGE 480.

**Chemical Family:** S-triazine.

**Crop and/or Non-Crop Registrations:** Corn (ensilage, field, seed and sweet), lowbush blueberries and triazine-tolerant canola.

**Sensitive Weeds:** Will control a wide range of broadleaf weeds such as mustards, purslane, ragweed, smartweed, lady's-thumb, wild buckwheat, lamb's-quarters, pigweed and volunteer clover. Populations of lamb's-quarters, pigweed and ragweed have been found that are resistant to atrazine and are therefore not controlled.

**Uptake and Translocation:** Actively absorbed by roots and foliage, although foliar absorption is usually small. It is translocated to the top of the plant and

accumulates in the leaf margins and the growing points.

**Basis of Selectivity:** Metabolism by tolerant species.  
**Application Methods:** For corn, preplant incorporated, preemergence, or postemergence (with or without oil) usually before the annual weeds are more than 4 cm high; under dry weather conditions a shallow incorporation may enhance activity; oil or oil/surfactant blends will increase the postemergence activity. For lowbush blueberries, preemergence application. For triazine-tolerant canola, postemergence. Dry bulk fertilizer may be impregnated with atrazine and applied preplant incorporated. Atrazine may be tank-mixed with several other annual grass and broadleaf herbicides to increase the spectrum of weed control in corn.

**Residual Activity:** Can persist in the soil for varying lengths of time depending on rate, weather and soil conditions (longer under dry, cool weather conditions and in sandy soils). Postemergence treatments tend to persist longer than preemergence treatments. Refer to Tables 4-4 and 4-5. *Hericide Crop Rotation and Soil pH Restrictions*, page 70 and page 72, for information on rotational crop restrictions.

## BENSULIDE

**Trade Name:** BETASAN, PREFAR 4.8-E.

**Chemical Family:** Benzenesulfonamide.

**Crop and/or Non-Crop Registrations:** Lawns, turf and cucumbers.

**Sensitive Weeds:** Germinating annual grasses such as annual bluegrass, barnyard grass, crabgrass and foxtail. Some control of redroot pigweed, lamb's-quarters and shepherd's-purse.

**Uptake and Translocation:** Adsorbed on root surfaces and a small amount is absorbed by the roots. Little or none is translocated upward to the leaves.

**Basis of Selectivity:** Inhibits root growth and partially inhibits cell division in sensitive seedlings.

NOTES ON HERBICIDES: BENSULIDE

Sensitive species affected only in seedling stage. Metabolized by established grasses.

**Application Methods:** Preemergence in spring or fall for turf (well-established only); a higher rate is required for fall applications to control germinating weeds the following spring; incorporate by lightly irrigating into soil.

**Residual Activity:** Season-long weed control.

Degraded slowly by soil micro-organisms with a half-life of 4–6 months depending on soil type. Because of soil residues, only cucurbits, cole crops, carrots, lettuce, peppers and tomatoes should be planted the following year.

**Unique Characteristics:** Bensulide is inactivated in soils containing high amounts of organic matter (muck soils). Incorporation recommended to avoid photodecomposition. Do not reseed turf within 1 year of application.

## BENTAZON

**Trade Names:** BASAGRAN FORTÉ, BASAGRAN.

**Chemical Family:** Benzothiadiazine.

**Crop and/or Non-Crop Registrations:** BASAGRAN

FORTÉ AND BASAGRAN: Corn (field, seed and sweet), dry beans (refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97), faba beans, flax, millet, peas, sorghum and soybeans, BASAGRAN specific registrations: highbush blueberries, new plantings of apples, apricots, cherries, peaches, pears, turf, alfalfa, red clover, alsike clover, sainfoin, broegrass, creeping red fescue, meadow foxtail, orchardgrass, timothy, crested wheatgrass.

**Sensitive Weeds:** Annual broadleaf weeds including hairy nightshade, lamb's-quarters, redroot pigweed, low cudweed, purslane, common ragweed, wild radish, Russian thistle, hairy galinsoga, corn spurry, bird rape, flower-of-an-hour, buttercups, common groundsel, jimsonweed, giant ragweed, velvetleaf, lady's-thumb, wild mustard, cocklebur, stinkweed, shepherd's-purse and common chickweed.

Triazine-tolerant biotypes of lamb's-quarters, redroot pigweed, common ragweed and common groundsel are also controlled. Top growth of Canada thistle and nutsedge are controlled. Field bindweed may be suppressed by 2 applications applied 10 days apart.

**Uptake and Translocation:** Taken up through the foliage. Not translocated.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Postemergence when weeds are small and actively growing. Apply in 100–400 L water/ha. Crop must be in a tolerant growth stage (see specific recommendations on label). Thorough spray coverage is necessary. Use flat fan nozzles tilted 45° forward. Use ASSIST OIL CONCENTRATE with BASAGRAN. Reduce the ASSIST rate under hot, humid conditions. Liquid ammonium sulphate or 28% urea ammonium nitrate may be added to BASAGRAN FORTÉ or BASAGRAN for improved and more consistent control of velvetleaf and lamb's-quarters in soybeans only. BASAGRAN FORTÉ does not require additional adjuvants.

**Residual Activity:** None.

**Unique Characteristics:** Corn and turf are tolerant at all stages of growth. Bentazon is not volatile. Temporary crop injury can be expected if bentazon is applied during hot, humid weather or if crop is stressed (flooding, drought, cold). Cool weather or drought may delay control. Rainfall within 6–8 hours after application may reduce effectiveness. Since there is no residual activity, a new flush of weeds may emerge after the first flush has been controlled.

## BENTAZON/ATRAZINE

**Trade Name:** LADDOK.

**Chemical Family:** Benzothiadiazine/s-triazine.

**Crop and/or Non-Crop Registrations:** Corn (ensilage, field, seed and sweet).

**Sensitive Weeds:** Annual broadleaf weeds such as eastern black nightshade, redroot pigweed, lamb's-quarters, low cudweed, purslane, common ragweed, Russian thistle, corn spurry, flower-of-an-hour, lady's-thumb, wild mustard, hairy galinsoga, bird rape, buttercup, common chickweed, common groundsel, jimsonweed, giant ragweed, velvetleaf and cocklebur. Triazine-tolerant biotypes are also controlled. Top growth of Canada thistle and nutsedge are controlled. Field bindweed may be suppressed.

**Uptake and Translocation:** Uptake into the plant occurs primarily through the leaves. Bentazon/ atrazine has mainly contact action and translocation is minimal.

**Basis of Selectivity:** Metabolism by tolerant species.  
**Application Methods:** Apply Bentazon/atrazine

early postemergence when weeds are small and actively growing. Apply in 200–400 L water/ha. Apply before weeds reach the maximum size listed on the label. This generally corresponds to corn in the 1–5 leaf stage. Under good growing conditions, the most effective time for spraying will usually be 18–28 days after planting. Add ASSIST OIL CONCENTRATE to the spray tank for all applications. Thorough spray coverage is important and use flat fan nozzles. The use of flooding nozzles is not recommended because of inadequate coverage.

**Residual Activity:** Injury may occur to any crop other than corn planted in the same season on land treated with bentazon/atrazine. In the season after application, there is virtually no hazard to most rotational crops when label rates for annual weed control have been used. Overlap or the use of a double application for nutsedge control may result in injury to rotational crops due to carry over of the atrazine component of bentazon/atrazine.

**Unique Characteristics:** Corn is tolerant at all stages of growth. Rainfall within 6–8 hours of application may reduce effectiveness of the spray solution.

Bentazon/atrazine is not volatile but it should not be applied when crop is under stress from prolonged cold, wet weather, poor fertility or other factors.

## BROMACIL

**Trade Name:** HYVAR X-L.

**Chemical Family:** Uracil.

**Crop and/or Non-Crop Registrations:** Non-cropland for total vegetation control and as a spot treatment to control brush.

**Sensitive Weeds:** Annual and perennial broadleaf weeds and grasses (broadcast application). Several brush species (spot application).

**Uptake and Translocation:** Most readily absorbed through the roots. Surfactants can enhance foliar activity. Translocation is upward with the movement of water to leaves where it inhibits photosynthesis.

**Basis of Selectivity:** Non-selective at normal rates.

**Application Methods:** For herbaceous weeds, broadcast sprayed, preferably just before or during periods of active weed growth. For brush, spot applications with an exact-delivery handgun sprayer either at the base of target brush or on a grid.

**Residual Activity:** Half-life is 5–6 months for 4.4 kg/ha bromacil in a silty loam soil.

**Unique Characteristics:** Do not use Bromacil where it is likely to leach, wash or move with eroded soil into contact with the roots of desirable trees and shrubs. Do not apply to brush growing in water.

## BROMACIL/DIURON

**Trade Name:** KROVAR.

**Chemical Family:** Uracil/substituted urea.

**Crop and/or Non-Crop Registrations:** Non-cropland.

**Sensitive Weeds:** Most herbaceous weeds.

**Basis of Selectivity:** Non-selective.

**Application Method:** Broadcast spray just before or during the period of active weed growth.

**Unique Characteristics:** Normally fewer species of weeds escape or regrow after use of this mixture compared to use of the same amount of either chemical alone. Also see notes on BROMACIL and DIURON.

## BROMOXYNIL

**Trade Name:** BROMOTRIL, BROTEX, KORIL, PARDNER.

**Chemical Family:** Hydroxybenzonitrile.

**Crop and/or Non-Crop Registrations:** Alfalfa (seedling, established-seed), barley, canary grass (seed), corn, dry bulb onions, fall rye, flax, garlic, oats, millet, sorghum, triticale, and wheat (Durum, spring, winter).

**Sensitive Weeds:** Smartweed, nightshade, velvetleaf, pigweed, common ragweed, cocklebur, stinkweed, and wild mustard are killed if the chemical thoroughly contacts these plants before they have more than 4 true leaves; wild buckwheat and lamb's-quarters control to 8 leaf. Most established perennial broadleaf weeds, chickweed and grasses tolerate typical field rates of this herbicide.

**Uptake and Translocation:** Absorbed by plant foliage and moves very little within the plant.

**Basis of Selectivity:** Differential spray retention, uptake, translocation and degradation.

**Application Method:** Postemergence.

**Residual Activity:** Essentially no soil residual activity.

**Unique Characteristics:** Crop injury symptoms (leaf scorch) may develop if the plant is under stress within 2 or 3 days before or after spraying; this stress could be caused by high temperatures or high humidity or, in the case of corn, application following a period of cool, wet weather; such injury usually does not affect yields. The formulation includes a wetting agent to improve the spread of droplets on the leaf. Although bromoxynil is not an effective soil-applied herbicide, broadleaf crops such as turnips, peas and beans should not be seeded for a week after spray application.

## BROMOXYNIL/MCPA

**Trade Names:** BADGE, BUCTRIL M, LOGIC M, MEXTROL.

**Chemical Family:** Hydroxybenzonitrile/phenoxy.

**Crop and/or Non-Crop Registrations:** Spring and winter wheat, barley, oats, flax, fall rye, corn, timothy hay and canary grass.

**Unique Characteristics:** Combination of bromoxynil with MCPA provides better control of mustards than bromoxynil alone. Also see notes on BROMOXYNIL and MCPA.

## CARFENTRAZONE-ETHYL

**Trade Name:** AIM EC.

**Chemical Family:** Aryl triazolinone.

**Crop and/or Non-Crop Registrations:** Preplant burndown (all crops except tobacco, asparagus, ginseng, nursery stock and turfbeds); hooded sprayer applications (for use in root, tuber, bulb, legume, fruiting and leafy vegetables, pome and stone fruits and berries – refer to product label for specific crop registrations); harvest aid treatment for potatoes, dry beans, soybeans and cereals.

**Sensitive Weeds:** 36.5 mL/ha rate – redroot pigweed, velvetleaf. 58 mL/ha rate – lamb's-quarters, mallow, hairy nightshade, field pennycress, pigweed (prostrate, smooth and tumble), purslane, smartweed, tall waterhemp, tansy mustard. 73 mL/ha rate – carpetweed, cocklebur, eastern black nightshade, jimsonweed, kochia, volunteer canola. 117 mL/ha rate – burclover, prickly lettuce and corn spurry.

**Uptake and Translocation:** Carfentrazone-ethyl is taken up through the foliage and not readily translocated.

**Basis of Selectivity:** Metabolism.

**Application Methods:** Coverage of the weeds is essential for good control. For dessication, apply when the crop is mature and the grain has begun to dry down.

**Residual Activity:** None.

NOTES ON HERBICIDES: BROMOXYNIL/MCPA

**Unique Characteristics:** AIM EC is a non-residual product and will not injure subsequent crops.

## CARFENTRAZONE-ETHYL + GLYPHOSATE

**Trade Name:** CLEANSTART PLUS (co-pack of AIM EC + CREDIT PLUS).

**Chemical Family:** Aryl triazolinone + Amino acid.

**Crop and/or Non-Crop Registrations:** Preplant burndown (all crops except tobacco, asparagus, ginseng, nursery stock and turfbeds).

**For All Other Information:** Refer to carfentrazone-ethyl and glyphosate alone.

## CHLORIMURON-ETHYL

**Trade Name:** CLASSIC.

**Chemical Family:** Sulfonylurea.

**Crop and/or Non-Crop Registrations:** Soybeans.

**Sensitive Weeds:** Common ragweed, dandelion, redroot pigweed, velvetleaf and yellow nutsedge.

**Uptake and Translocation:** Following foliar application, chlorimuron is rapidly absorbed through the leaves and translocated in both xylem and phloem.

**Basis of Selectivity:** Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert chlorimuron to non-phytotoxic metabolites.

**Application Methods:** Postemergence.

**Residual Activity:** Chlorimuron-ethyl will provide some limited residual activity after application.

**Unique Characteristics:** A non-ionic surfactant must be added at 0.2% v/v. 28% Urea ammonium nitrate (U.A.N.) at 2 L/ha will improve the control of velvetleaf. Typical symptoms of plant death (chlorosis, necrosis) may occur from 1–3 weeks after application, depending on growing conditions. Favourable growing conditions will speed the activity while cool or dry conditions will delay it.

## CHLORIMURON-ETHYL + GLYPHOSATE

**Trade Name:** GUARDIAN (co-pack of CLASSIC and POLARIS).

**Chemical Family:** Sulfonylurea, Amino acid .

**Crop and/or Non-Crop Registrations:** Preplant to Soybeans. Postemergence only to glyphosate tolerant ("Roundup Ready") soybean varieties.

**Sensitive Weeds:** Season long control of dandelion (preplant). Season long control of annual sow-thistle, dandelion and yellow nutsedge (post).

**For All Other Information:** Refer to chlorimuron-ethyl and glyphosate alone.

## CHLORIMURON-ETHYL + FLUMIOXAZIN + GLYPHOSATE

**Trade Name:** GUARDIAN PLUS (co-pack of CLASSIC, VALTERA and POLARIS).

**Chemical Family:** Sulfonylurea, Amino acid.

**Crop and/or Non-Crop Registrations:** Preplant to soybeans.

**For All Other Information:** Refer to chlorimuron-ethyl, flumioxazin and glyphosate alone.

## CHLORSULFURON

**Trade Name:** TELAR.

**Chemical Family:** Sulfonyl urea.

**Crop and/or Non-Crop Registrations:** Non-cropland.

**Sensitive Weeds:** Annual and perennial broadleaf weeds such as wild carrot, Canada thistle, sow-thistle, scentless chamomile, lamb's-quarters, wild mustard, redroot pigweed, stinkweed, cow cockle, chickweed and Russian thistle.

**Uptake and Translocation:** Thoroughly systemic after absorption of either foliage or roots. Foliar absorption is rapid.

**Basis of Selectivity:** A disruption of amino acid metabolism leads to an inhibition of cell division in sensitive plants. Faster rates of metabolic detoxification have been observed in tolerant species.

**Application Methods:** Preemergence or early postemergence.

**Residual Activity:** Half-life is 4–6 weeks under growing season conditions. Degradation is faster with higher soil temperatures and/or lower soil pH.

**Unique Characteristics:** Although degradation is moderately rapid, extremely low residues can be highly toxic to some broadleaf weeds, such as wild carrot, for up to 2 years after application. Use of this product requires a surfactant.

## CHLORTHAL DIMETHYL

**Trade Name:** DACTHAL W-75.

**Chemical Family:** Phthalate.

**Crop and/or Non-Crop Registrations:** Broccoli, Brussels sprouts, cabbage, cauliflower, dry and snap beans, eggplant, established ornamentals, garlic, turf, onions, peppers, potatoes, seeded melons, soybeans, strawberries, sweet potatoes, tomatoes, woody nursery stock.

**Sensitive Weeds:** Germinating annual grasses and certain annual broadleaf weeds such as lamb's-quarters, purslane, common chickweed, redroot pigweed, carpetweed and groundcherry.

**Uptake and Translocation:** Absorbed by roots but not foliage. Does not translocate within the plant.

**Basis of Selectivity:** Inhibits growth of germinating seeds; exact mechanism not yet known.

**Application Method:** Must be applied prior to weed seed germination. Depending on the crop, may be applied preplant incorporated, preemergence, postemergence or post transplant to crop. At least 1 cm of water as either rain or irrigation is necessary to activate the herbicide. In turf, spring or fall application is satisfactory.

**Residual Activity:** Average half-life is 100 days in most general soil types. Effective weed control may be maintained for as long as 2 months, depending on application rate and soil type.

**Unique Characteristics:** May be applied over the top of most plants with no phytotoxic effects. Has little

herbicidal activity on velvetleaf, common ragweed, wild mustard, jimsonweed, galinsoga, smartweed, nutsedge and cocklebur. Established turf fields (with the exception of the bent grasses) have good tolerance. Turf should not be reseeded for 60 days after treatment. Use only on mineral soils.

## CITRIC ACID + LACTIC ACID

**Trade Name:** ORGANO-SOL.

**Crop and/or Non-Crop Registrations:** Lawns and turf.

**Sensitive Weeds:** Partial suppression of white clover, red clover, bird's-foot trefoil, black medic and wood sorrel.

## CLETHODIM

**Trade Name:** ARROW, SELECT.

**Chemical Family:** Cyclohexanone.

**Crop and/or Non-Crop Registrations:** Blueberries, canola, coriander, flax, a number of different edible bean market classes, refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97 for specific crop registrations, mustard greens, soybeans, spinach, sunflowers, dry onions, and potatoes.

**Sensitive Weeds:** Annual grasses (wild oats, green and yellow foxtail, volunteer cereals, volunteer corn and barnyard grass).

**Uptake and Translocation:** Uptake through the foliage and translocated through both the phloem and xylem throughout the plant accumulating in the meristematic regions both above and below the ground.

**Basis of Selectivity:** Tolerant plants rapidly metabolize clethodim to several conjugated metabolites.

**Application Method:** Postemergent to actively growing grasses in the 2–6 true-leaf stage.

**Residual Activity:** Rapid degradation in both soil and water with no soil activity.

**Unique Characteristics:** Highly active on all annual grasses and volunteer cereals at one low dose

rate of 0.19 L/ha in a tank-mix with the adjuvant CC-16255.

## CLOMAZONE

**Trade Names:** COMMAND 360 ME.

**Chemical Family:** Isoxazolidinone.

**Crop and/or Non-Crop Registrations:** Field cucumber, melons, processing pumpkins, squash, soybeans, sweet potatoes.

**Sensitive Weeds:** Velvetleaf, lamb's-quarters, lady's thumb, eastern black nightshade, barnyardgrass, green foxtail, yellow foxtail.

**Uptake and Translocation:** Primarily absorbed through the roots and is translocated through the xylem in the plant.

**Basis of Selectivity:** Clomazone is metalized in soybeans.

**Application Methods:** Preemergence.

**Residual Activity:** When applied at recommended rates, Command 360 ME will provide season long weed control. It is relatively immobile in soil and microbial decomposition is the principle path of dissipation. Some rotational restrictions apply, refer to Tables 4-4 and 4-5. *Herbicide Crop Rotation and Soil pH Restrictions*, page 70 and page 72, for more information. Soil texture impacts residual and product efficacy, see product label for appropriate rates.

**Unique Characteristics:** Sensitive plants in the application zone will turn white (bleached) as carotenoid biosynthesis is inhibited.

## CLOPYRALID

**Trade Names:** LONTREL 360.

**Chemical Family:** Pyridine.

**Crop and/or Non-Crop Registrations:** Strawberries, highbush blueberries, new and bearing apples, cranberries, sugar beets, rutabagas, cole crops (cabbage, cauliflower, broccoli, asian cole crops), canola, barley, oats, wheat, control of

broadleaf weeds in rights-of-way (hydro, railroad, communication lines, pipelines) and associated stations, industrial manufacturing sites, storage sites and roadsides, airports, military bases and low maintenance, rough-turf areas, rangeland, grass pasture and balsam fir Christmas tree stands or plantations.

**Sensitive Weeds:** Will control or suppress certain annual and perennial weeds including Canada thistle, goldenrod, ox-eye daisy, tufted vetch, sheep sorrel, dandelion and wild buckwheat, scentless chamomile, groundsel, ragweed, coltsfoot and spotted knapweed.

**Uptake and Translocation:** Rapidly absorbed by foliage and translocated readily throughout the plant via both xylem and phloem systems. Clopyralid is distributed throughout the plant to the meristem.

**Basis of Selectivity:** Effects on nucleic acid metabolism and growth are not observed in grasses and other tolerant species.

**Application Methods:** Postemergence as a broadcast or selective foliar.

**Residual Activity:** Half-life in soil is less than 30 days under conditions that are favourable for microbial degradation. Little to no residual activity.

**Unique Characteristics:** Clopyralid has little to no activity on woody vegetation, except woody species of the legume family.

## CLORANSULAM-METHYL

**Trade Name:** FIRSTRATE.

**Chemical Family:** Triazolopyrimidine sulfonanilide.

**Crop and/or Non-Crop Registrations:** Soybeans.

**Sensitive Weeds:** Common ragweed, cocklebur, velvetleaf, and lamb's-quarters (Pre). Cocklebur, common ragweed, giant ragweed, jimsonweed and velvetleaf (Post).

**Uptake and Translocation:** Absorption by roots, shoots and foliage. Translocation via the xylem and phloem and accumulation in the growing points.

**Basis of Selectivity:** Metabolism by soybeans.

Inhibition of the acetolactase synthase (ALS) enzyme in susceptible plants followed by a rapid cessation of cell division and plant growth.

**Application Methods:** Preemergence in both conventional and conservation tillage systems or postemergence prior to the flowering stage of soybeans.

**Residual Activity:** Decomposition in soils is attributed primarily to microbial degradation. Some rotational cropping restrictions apply. Refer to Tables 4-4 and 4-5, *Herbicide Crop Rotation and Soil pH Restrictions*, on page 70, and page 72 for additional information.

**Unique Characteristics:** Do not apply to peat or muck soils. Preemergence or postemergence applications require an activating rainfall that moistens the soil to a depth of at least 5 cm in order to move FIRSTRATE into the weed germination zone. If adequate rainfall is not received within 7–10 days after application, a shallow cultivation or use of a rotary hoe is recommended. Do not apply when air temperature is near freezing or when freezing conditions are expected for several days following time of application. Extended cold, wet conditions or abnormally high soil moisture conditions during emergence and early crop development may cause injury symptoms on soybeans such as temporary yellowing of the leaves and/or crop stunting. Soybeans will quickly outgrow these symptoms once normal growing conditions resume.

Postemergence application prior to full emergence of the first trifoliate leaf may cause temporary yellowing of soybeans. This effect is transient and has no effect on soybean yields. Postemergence application requires the addition of a non-ionic surfactant (Agral 90) and a liquid ammonium fertilizer (28-0-0 or 32-0-0). See label for details.

## COPPER SULPHATE

**Trade Name:** MAGNACIDE H, POLYDEX BACTERIOSTATIC ALGAECIDE MC, POLYDEX BACTERIOSTATIC ALGAECIDE, POLYPRO, POND WIZARD ALGAECIDE, THINK PURITY ALGAECIDE SOLUTION, THINK PURITY ALGAECIDE AND ODOUR CONTROL SOLUTION, TRIANGLE BRAND COPPER SULPHATE – Contact manufacturer for more information.

## CORN GLUTEN MEAL

**Trade Name:** TURFMAIZE.

**Chemical Family:** TURFMAIZE is a non-chemical product.

**Crop and/or Non-Crop Registrations:** Established Kentucky bluegrass.

**Sensitive Weeds:** Inhibits germination of smooth crabgrass and dandelion.

**Uptake and Translocation:** Not available.

**Application Methods:** Applied before smooth crabgrass and dandelion germination to established Kentucky blue-grass turf in the spring, late summer or fall.

## DAZOMET

**Trade Name:** BASAMID.

**Chemical Family:** Dithiocarbamate.

**Crop and/or Non-Crop Registrations:** Field and greenhouse vegetable seedbeds for eggplant, lettuce, pepper and tomato; fall treatment only of tobacco greenhouse seedbeds; forest nurseries, seed or propagation beds (field, greenhouse) for conifer, deciduous, ornamentals; field and greenhouse seed and planting beds for annual flowers; turf seedbeds.

**Sensitive Weeds:** Most germinating weed seeds.

**Uptake and Translocation:** Breaks down on contact with soil moisture and releases toxic gases that control germinating weed seeds.

## NOTES ON HERBICIDES: CLORANSULAM-METHYL

## 4. HERBICIDES USED IN ONTARIO

**Basis of Selectivity:** Non-selective. Chemical must be completely dissipated from the seedbed before planting or injury may occur. Breaks down on contact with soil moisture and releases toxic gases that control germinating weed seeds.

**Application Methods:** Apply granular product to a well-worked seedbed and incorporate evenly. Seal soil immediately after incorporation by rolling and flooding or by covering with heavy polyethylene plastic and sealing edges. After a waiting period of 10–40 days, depending on soil temperature, aerate the soil. Conduct a safety germination test before using treated soil. Do not use when soil temperature is below 5°C.

**Residual Activity:** Depends on the rate applied, soil moisture and soil temperature. The gases are toxic to all growing plants and a safety germination test must be carried out to determine that the soil is safe for planting.

**Unique Characteristics:** Also controls uncysted nematodes and soil fungi.

## DESMEDIPHAM/PHENMEDIPHAM

**Trade Name:** BETAMIX.

**Chemical Family:** Phenylcarbamate.

**Crop and/or Non-Crop Registrations:** Red garden beets, sugar beets.

**Sensitive Weeds:** Pigweed species, lamb's-quarters, mustard species, wild buckwheat, green and yellow foxtail.

**Uptake and Translocation:** Desmedipham/phenmedipham is readily absorbed by foliage where it inhibits photosynthesis in the chloroplasts of leaf cells.

**Basis of Selectivity:** Rapid metabolism in tolerant species.

**Application Methods:** Postemergence beginning at the 2 true-leaf stage of sugar beets. Up to the 2 or 4 leaf stage of weeds depending upon species. Best control is exhibited on very small, actively growing

weeds. Apply to red garden beets before the beets reach the 4 leaf stage.

**Residual Activity:** Soil half-life of desmedipham is less than 1 month and of phenmedipham is 25–30 days.

**Unique Characteristics:** Desmedipham/phenmedipham may cause temporary growth retardation and/or chlorosis or tip-burn to sugar beets when applied to stressed plants. Normal growth is resumed in 10 days after application.

## DICAMBA

**Trade Names:** BANVEL II, HAWKEYE™ POWER, ORACLE, VANQUISH, VMD 480.

**Chemical Family:** Benzoic acid.

**Crop and/or Non-Crop Registrations:** Field corn, spring and winter wheat, spring barley, spring rye, oats, summer fallow and stubble, pastures, red fescue, lowbush blueberries and turf; non-crop areas such as roadsides, utility rights-of-way and railways.

**Sensitive Weeds:** Annual weeds (1.25 L/ha): buckwheat (tartary, wild), cleavers, corn spurry, cow cockle, Canada fleabane, common ragweed, giant ragweed, lady's thumb, lamb's-quarters, mustard spp., pigweed spp., smartweed and velvetleaf. Perennial weeds (1.25 L/ha): field bindweed, sow-thistle (perennial), Canada thistle. Brush weeds (when tank-mixed with 2,4-D): alder, aspen poplar, cherry, western snowberry, wolf willow, prickly rose and wild rose.

**Uptake and Translocation:** Readily absorbed by roots, stems or leaves and then translocated to other plant parts.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Preemergence or postemergence in field corn. For all other crops and non-crop uses, postemergence applications are recommended.

**Residual Activity:** Half-life in soil is approximately 30 days. Residue carryover into the next season is not a problem when applied at rates recommended for crop situations.

**Unique Characteristics:** Dicamba is often mixed with grass herbicides or with phenoxy herbicides to provide a broader spectrum of weed control. Spray drift is toxic to sensitive plants in the same manner as 2,4-D, thus similar precautions should be followed. Cold weather conditions and/or subsequent high rainfall after dicamba application may lead to temporary corn injury particularly on early-season hybrids in Eastern Ontario. There is also a possibility of dicamba vapour drift from treated plant foliage during high temperatures (in excess of 25°C). At higher rates, dicamba can be toxic to trees and shrubs having roots under the treated areas.

## DICAMBA/ATRAZINE

**Trade Name:** MARKSMAN, PROPERO.

**Chemical Family:** Benzoic acid/s-triazine.

**Crop and/or Non-Crop Registrations:** Field corn.

**Sensitive Weeds:** Buckwheat (wild, tartary), cleavers, cocklebur (emerged only), corn spurry, cow cockle, field bindweed, green smartweed, lady's thumb, lamb's-quarters, mustards, pigweed (redroot, Russian), ragweed (common and giant), sow-thistle (perennial), Canada thistle, velvetleaf, volunteer adzuki beans, waterhemp.

**Application Methods:** Preemergence and Postemergence until the standing height of the corn is 13 cm (5 leaf stage).

**Unique Characteristics:** Provides season long broadleaf weed control in corn. Provides excellent control of triazine-resistant broadleaf weeds and is particularly effective in controlling velvetleaf and other later-germinating deep-rooted annuals.

## DICAMBA/MCPA

**Trade Name:** DYVEL.

**Chemical Family:** Benzoic acid/phenoxy.

**Crop and/or Non-Crop Registrations:** Barley, spring wheat, winter wheat and oats.

**Unique Characteristics:** Provides better control of mustards and hemp-nettle than dicamba alone. Also see notes on DICAMBA and MCPA.

### DICAMBA/MCPA/MECOPROP-P

**Trade Name:** SWORD, TARGET, TRACKER XP.

**Chemical Family:** Benzoic acid/phenoxy/phenoxy.

**Crop and/or Non-Crop Registrations:** Spring wheat, barley, oats not underseeded to legumes, stubble fields and summer fallow.

**Sensitive Weeds:** At field-crop rates: wild buckwheat, cow cockle, lady's-thumb, green smartweed, mustards, hemp-nettle, Russian thistle, corn spurry, flixweed, annual sow-thistle, shepherd's-purse, common ragweed, pigweeds, chickweed, lamb's-quarters, knotweed, volunteer rapeseed and sunflowers.

**Application Methods:** Postemergence when weed seedlings are in the 2–3 leaf stage, spring wheat and oats are in the 4–5 leaf stage and barley is in the 2–3 leaf stage. Use water carrier and apply at 100 L total spray mix/ha.

**Unique Characteristics:** This mixture controls a wider spectrum of weeds than any of the herbicide components used alone. Under certain conditions, this mixture may cause shortening of the straw of cereals but yield will not be affected. See also DICAMBA, MECOPROP-P and MCPA.

### DICHLOBENIL

**Trade Name:** CASORON 4G.

**Chemical Family:** Benzonitrile.

**Crop and/or Non-Crop Registrations:** Cranberries, fruit trees, grapes, highbush blueberries, raspberries, container nursery stock, woody nursery stock, shelterbelts and non-crop areas.

**Sensitive Weeds:** Most weeds are susceptible to or suppressed by, dichlobenil including perennials, vetch and horsetail.

**Uptake and Translocation:** Absorbed by the roots and rapidly translocated upward in the plant.

**Basis of Selectivity:** Selectivity is based on physical separation between the dichlobenil vapour layer in the top 5 cm of soil and the established crop roots below this level.

**Application Methods:** Apply preemergence to the weeds, preferably in either fall or early spring.

**Residual Activity:** May persist and provide weed control for 2–6 months; higher rates and applications following use in previous year(s) may result in soil residues persisting for longer than 1 year.

**Unique Characteristics:** Although applied as a granular herbicide it kills by means of a vapour phase in the top soil profile. Weed roots take up the herbicide as they enter this zone. Do not apply dichlobenil during periods of high soil temperature, since loss of control will result due to volatilization of the herbicide.

### DICHLORPROP/2,4-D

**Trade Names:** DESORMONE, DICHLORPROP D, DICHLORPROP DX, DIPHENOPROP BK 700, ESTAPROP PLUS, ESTAPROP XT, TURBOPROP.

**Chemical Family:** Phenoxy/phenoxy.

**Crop and/or Non-Crop Registrations:** Spring and fall wheat and barley; perennial weed and brush control on non-cropland.

**Sensitive Weeds:** 2.75 L/ha – annual sow-thistle, bluebur, burdock, common ragweed, Canada thistle, cocklebur, curled dock, dandelion, dog mustard, flixweed, giant ragweed, kochia, lady's thumb, lamb's-quarters, night-flowering catchfly, oak-leaved goosefoot, perennial sow-thistle, prickly lettuce, mustard spp., pigweed (redroot, Russian), round leaved mallow, Russian thistle, shepherd's-purse, smartweed spp., spreading atriplex, stinkweed, stork's-bill, volunteer canola, volunteer sunflower and wild buckwheat.

**Unique Characteristics:** Most properties of dichlorprop are very similar to those of 2,4-D. Chickweed, wild buckwheat, smartweed and some woody species are more sensitive to dichlorprop/2,4-D than to 2,4-D alone. Do not use on oats. See also 2,4-D, page 38.

### DIFLUFENZOPYR/DICAMBA

**Trade Name:** DISTINCT.

**Chemical Family:** Semicarbazone/Benzoic acid.

**Crop and/or Non-Crop Registrations:** Field corn (silage and grain).

**Sensitive Weeds:** Redroot pigweed, common ragweed, lamb's-quarters, wild buckwheat, lady's-thumb, Canada thistle, cocklebur (emerged), waterhemp (tall) and velvetleaf. Controls horsetail and horsetail when tank-mixed with nicosulfuron/rimsulfuron. Control is best when weeds are actively growing.

**Uptake and Translocation:** Readily absorbed by roots, stems or leaves and then translocated to other plant parts.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Early postemergence to 6 leaf corn recommended.

**Residual Activity:** Half-life in soil is approximately 30 days. Residue carryover into the next season is not a problem when applied at registered rates.

**Unique Characteristics:** This product has a wider application window, a lower use rate and has better activity on perennial weeds than dicamba alone. Spray drift is toxic to sensitive plants in the same manner as 2,4-D, thus similar precautions should be followed. The auxin transport inhibitor, diflufenzopyr, will also be active with other growth hormone herbicides such as 2,4-D and clopyralid and may cause crop injury if tank-mixed. Do not use additives such as oils, ionic surfactants, wetting agents, sticking agents, etc. Do not apply when there is a risk of severe drop in night temperature. Do not spray when temperatures are

expected to exceed 27°C. Do not spray in high humidity or fog. Do not apply preemergence on sandy or sandy loam soils. Do not till or cultivate treated area for at least 7 days following application. Adding a non-ionic surfactant at 0.25% v/v plus liquid nitrogen fertilizer 28-0-0 at 1.25% is recommended under postemergence applications.

#### DIMETHENAMID-P

**Trade Name:** FRONTIER MAX.

**Chemical Family:** Chloroacetamide.

**Crop and/or Non-Crop Registrations:** Corn (field, seed and sweet), dry beans (kidney, otebo and white), peanuts, soybeans, cabbage (transplanted), dry bulb onions and non-bearing grape vines.

**Sensitive Weeds:** Green and yellow foxtail, barnyard grass, fall panicum, witchgrass, large and smooth crabgrass, redroot pigweed, eastern black nightshade, and tall waterhemp. Yellow nutsedge can be controlled with a preplant incorporated application.

**Uptake and Translocation:** Absorbed through shoots and roots of germinating grass and broadleaf weeds but primarily via plant coleoptile.

**Basis of Selectivity:** Not established.

**Application Method:** 1) preplant incorporated – incorporate with vibrating shank cultivator, harrow or other implement capable of giving uniform shallow incorporation into the top 5 cm of the soil within 7 days of planting; 2) preemergence – rainfall is needed within 10 days of application to achieve sufficient herbicide activation; 3) early postemergence (corn only) – apply at the spike to 3 leaf stage of corn and up to the 2 leaf stage of annual grass weeds.

**Residual Activity:** Provides season-long weed control. Length of residual activity depends upon soil and moisture factors, application rate and timing. Heavy rainfall following an incorporated treatment may reduce weed control.

**Unique Characteristics:** No recropping restrictions in the fall or spring application in corn or soybeans. Application flexibility; there are many tank-mix and sequential treatment options for broad-spectrum weed control in corn and soybeans in all tillage systems (zero tillage to conventional tillage). Mixes well with bulk liquid and dry fertilizers.

#### DIQUAT

**Trade Name:** REGLONE DESICCANT.

**Chemical Family:** Bipyridylum.

**Crop and/or Non-Crop Registrations:** Desiccation of canola, flax, dry beans, dry peas, mustard, sunflowers, soybeans, adzuki beans, legume seed crops. Vine killing of potatoes. Control of corn spurry in oats. Stale seedbed and inter-row weeding.

**Sensitive Weeds:** Any foliage contacted by diquat will be killed.

**Uptake and Translocation:** Rapidly absorbed by foliage. Limited translocation.

**Basis of Selectivity:** None.

**Application Methods:** Postemergence.

**Residual Activity:** Essentially none due to adsorption of chemical to soil particles.

**Unique Characteristics:** Must be used with clean (non-turbid) water as the soil particles in muddy water drastically reduce the effectiveness of diquat. Apply in weather conditions that will not promote drift. For aerial application suggested conditions for good application are moderate temperatures (less than 25°C), humidity (greater than 40%) and wind (3.6–10 km/h). Do not apply in dead calm conditions or when temperature inversion is likely (e.g., morning or evening when warm air is rising from crop). To avoid spray drift, use flat fan or hollow cone nozzles and a pressure of 140–210 kPa. For aerial application point the nozzles back 130°–180°. For further information on aerial application see product label.

#### DIQUAT (AQUATIC)

**Trade Name:** REWARD.

**Chemical Family:** Bipyridylum.

**Crop and/or Non-Crop Registrations:** Aquatic weed control in still or flowing water in ponds, ditches, lakes and canals.

**Sensitive Weeds:** Coontail, Canada Waterweed, pondweeds, milfoil and duckweed.

**Uptake and Translocation:** Contact desiccant with limited translocation.

**Basis of Selectivity:** None.

**Application Methods:** Postemergence. Apply when weeds are visible and are actively growing. It can be applied: with a boat bailer device that injects the chemical below the water surface; sprayed over the water surface; or poured directly from a container onto the surface.

**Residual Activity:** Quickly inactivated by adsorption to soil particles.

**Unique Characteristics:** Must be used with and applied on non-turbid water, as the soil particles in muddy water drastically reduce the effectiveness of the material. Do not use treated water for swimming or consumption by humans or animals for at least 24 hours. Do not use water for irrigation for 5 days after treatment. To avoid fish kills caused by oxygen depletion, treat only ¼–⅓ of the area at a time. Avoid application or drift onto crops, lawns, grazing areas, ornamental plants and other desirable plants.

#### DITHIOPYR

**Trade Name:** DIMENSION.

**Chemical Family:** Pyridine.

**Crop and/or Non-Crop Registrations:** Turf.

**Sensitive Weeds:** Crabgrass.

**Uptake and Translocation:** Absorbed through the shoots and roots. Limited translocation.

**Basis of Selectivity:** Differential uptake, translocation and metabolism in sensitive seedling weeds vs. established plants.

**Application Methods:** Preemergence or early postemergence up to the 3 leaf stage of crabgrass.

**Residual Activity:** Effective weed control may be maintained for 3 months.

**Unique Characteristics:** Preemergence and early postemergence activity allows control of emerged plants and follow-up residual control of later germinating crabgrass plants.

## DIURON

**Trade Name:** KARMEX, DIUREX 80WDG.

**Chemical Family:** Substituted urea.

**Crop and/or Non-Crop Registrations:** Grapes, asparagus, gladioli, industrial sites, right-of-ways.

**Sensitive Weeds:** Annual and perennial grasses, pigweed, ragweed, wild carrot and dandelion. Perennial weed control at higher rates in non-crop areas.

**Uptake and Translocation:** Most readily absorbed by roots, less so by foliage. Translocated upward in the xylem.

**Basis of Selectivity:** Used only in deep-rooted crops that are well established.

**Application Methods:** Applied to crops as a preemergence or directed early postemergence spray, preferably before weed growth becomes dense. Better control of emerged weeds is obtained by the addition of a suitable surfactant. In non-crop areas, diuron may be sprayed anytime except when ground is frozen.

**Residual Activity:** At lower rates used in crops, residues last about a year and thus applications may be repeated annually. At higher non-crop rates, persistence may be more than 1 year.

**Unique Characteristics:** Do not use where it is likely to leach or wash into contact with the roots of desirable trees or shrubs.

## EPTC

**Trade Name:** EPTAM.

**Chemical Family:** Thiocarbamate.

**Crop and/or Non-Crop Registrations:** Alfalfa, bird's-foot trefoil, flax, potatoes, sunflowers, sugar beets, turnips, and annual flowers. EPTAM, are registered for use dry on a number of different edible bean market classes, refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97 for specific crop registrations.

**Sensitive Weeds:** Annual grasses such as crabgrass, barnyard grass, fall panicum, wild oats, green foxtail and yellow foxtail; yellow nutsedge; some annual broadleaf weeds such as corn spurry, lamb's-quarters, nightshade, pigweed and chickweed if conditions are favourable for germination and growth.

**Uptake and Translocation:** Uptake by underground plant parts (roots, hypocotyl and seed). Upward translocation to the growing tip.

**Basis of Selectivity:** Metabolized by tolerant species at the seed germination stage through enzymatic breakdown of the chemical. Seed food reserves also permit seedling to outgrow chemical effect.

**Application Methods:** Preplant incorporated or postplant incorporated. May be applied using water or liquid fertilizers as the carrier. Dry fertilizers may also be used as a carrier when impregnated by licensed fertilizer dealers. To prevent chemical loss and reduced weed control, EPTC should be uniformly incorporated in the soil by setting the incorporation equipment (i.e., tandem disks, field cultivator with sweep teeth, or vibrating shank S-tine cultivator) to work the soil approximately 10 cm deep, followed by a levelling device. Irrigation (approximately 0.6 cm) can also be used to incorporate. When application and incorporation are done in separate operations, application should be on a dry soil surface.

**Residual Activity:** Applied in the spring preplant, EPTC provides season-long weed control with no

soil residues the following year to prevent crop rotation.

**Unique Characteristics:** EPTC does not need rainfall to activate and will not leach significantly under heavy rainfall. Under unfavourable germination conditions, leaf crinkling or leaf sealing may be observed on certain crops but usually without adverse effects on yield. May be tank-mixed with metribuzin for additional broadleaf weed control in potatoes. May be tank-mixed with ethalfluralin or trifluralin for additional broadleaf weed control in beans (white, snap and kidney). See label for other tank-mix combinations and information on less conventional application methods.

## ETHAMETSULFURON-METHYL

**Trade Name:** MUSTER.

**Chemical Family:** Sulfonyl urea.

**Crop and/or Non-Crop Registrations:** Spring canola.

**Sensitive Weeds:** Wild mustard.

**Uptake and Translocation:** Following foliar application, is rapidly absorbed and translocated in both xylem and phloem.

**Basis of Selectivity:** Inhibition of acetolactate synthase in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert etha-metsulfuron-methyl to non-phytotoxic metabolites.

**Application Methods:** Postemergence.

**Residual Activity:** Rapid soil microbial degradation.

**Unique Characteristics:** A non-ionic surfactant must be added. Typical symptoms of plant death (leaf crinkling, curling, chlorosis) occur 5–10 days after application depending on growing conditions.

## ETHOFUMESATE

**Trade Name:** NORTRON.

**Crop and/or Non-Crop Registrations:** Sugar beets.

**Sensitive Weeds:** Chickweed, lamb's-quarters, kochia, redroot pigweed, Russian thistle, wild buckwheat,

barnyard grass, large crabgrass, foxtails and downy brome.

**Uptake and Translocation:** Readily absorbed by emerging shoots (grass coleoptile and broadleaf hypocotyl) and roots, and translocated readily to the foliage. Postemergence applications of ethofumesate are poorly absorbed by maturing leaves with a well-developed cuticle.

**Basis of Selectivity:** Tolerant species conjugate the herbicide, rendering it inactive.

**Application Methods:** Preplant incorporated, preemergence.

**Residual Activity:** Half-life of less than 5 to more than 14 weeks depending on soil temperature and moisture conditions. Half-life increases in cooler, drier soils.

## FEHEDTA (IRON)

**Trade Name:** FIESTA LAWN WEED KILLER.

**Crop and/or Non-Crop Registrations:** Lawns and turf, non-crop areas.

**Sensitive Weeds:** dandelion, English daisy, false dandelion, white clover, black medic, bull thistle, Canada thistle, common chickweed, creeping buttercup, slender speedwell, narrow-leaved plantain, dove's-foot geranium, lawn burweed, moss, algae and broadleaved plantain (suppression).

## FENOXAPROP-P-ETHYL

**Trade Name:** EXCEL SUPER, ACCLAIM SUPER.

**Chemical Family:** Aryloxyphenoxypropionate.

**Crop and/or Non-Crop Registrations:** EXCEL SUPER – Asparagus, broccoli, cabbage, cauliflower, carrots, peas (field and processing), potatoes, canola, triazine-tolerant canola, soybeans, tomatoes. EXCEL SUPER is registered for use on a number of different edible bean market classes, refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97 for specific crop

registrations. ACCLAIM SUPER – Lawns and turf.

**Sensitive Weeds:** Barnyard grass, green and yellow foxtail, crabgrass, witchgrass, wild proso millet, fall panicum, volunteer corn.

**Uptake and Translocation:** Uptake primarily through the leaves. Does not translocate significantly.

**Basis of Selectivity:** Differential metabolism by tolerant vs. sensitive species.

**Application Methods:** Non-residual postemergence for the control of annual grasses (EXCEL SUPER – 1–6 leaf stage; ACCLAIM SUPER – 1–4 leaf stage plus 3 tillers). For best results, apply when weeds are young and actively growing. EXCEL SUPER – Do not apply if rainfall is expected within 1 hour of application. ACCLAIM SUPER – Do not apply if rainfall is expected within 3 hours of application.

**Residual Activity:** Essentially none.

**Unique Characteristics:** EXCEL can be tank-mixed with BASAGRAN FORTÉ and/or PINNACLE for broad-spectrum annual weed control in soybeans and dry beans only. If annual grasses are in the correct stage for application before broadleaf weeds have emerged, do not delay EXCEL SUPER application.

## FENOXAPROP-P-ETHYL/SAFENER

**Trade Name:** BENGAL, PUMA ADVANCE, VIGIL.

**Chemical Family:** Aryloxyphenoxypropionate.

**Crop and/or Non-Crop Registrations:** Spring wheat, spring barley (PUMA ADVANCE only).

**Sensitive Weeds:** Wild oats, foxtail (green, yellow) and barnyard grass.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Postemergence, apply to wild oats at the 1–6 leaf stage (plus 3 tillers) and prior to flag leaf emergence of spring wheat. For best results, apply when weeds are young and actively growing.

**Residual Activity:** Essentially none.

**Unique Characteristics:** PUMA ADVANCE can be tankmixed with BUCTRIL M for broad-spectrum annual broadleaf weed control in spring wheat. Treatment at the 3–4 leaf stage of crops and weeds usually combines maximum crop tolerance and weed susceptibility. Under stressed conditions and/or heavy crop canopy, earlier application will result in improved grassy weed control. PUMA ADVANCE contains a safener which allows spring cereals to metabolize fenoxyprop-p-ethyl. Spraying with a fenoxyprop-p-ethyl product not containing this safener (i.e. EXCEL SUPER) will result in severe crop injury.

## FLUAZIFOP-P-BUTYL

**Trade Names:** VENTURE L.

**Chemical Family:** Aryloxyphenoxypropionate.

**Crop and/or Non-Crop Registrations:** Flax, canola, soybeans, sugar beets, sunflowers, tobacco, forage legumes (alfalfa, red clover and bird's-foot trefoil), asparagus, cabbage, broccoli, Brussels sprouts, cauliflower, cucumber, ginseng, onions, potatoes, rutabagas, lupins, tomatoes, lowbush and highbush blueberries, raspberries, strawberries, non-grassy ornamental plants, poplars, shrubs, trees, apples, apricots, cherries, cranberries, grapes, peaches, pears and plums, forest and ornamental nurseries.

**Sensitive Weeds:** Barnyard grass, crabgrass, fall panicum, foxtail (giant, green, yellow), Johnson grass, volunteer corn, wheat and barley, wild oats, wirestem muhly, witchgrass, and quackgrass.

**Uptake and Translocation:** Absorbed primarily by leaves. Translocated to roots and rhizomes.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Postemergence. Apply when grasses are actively growing, and annual grasses are in the 2–5 leaf stage and quackgrass is in the 3–5 leaf stage.

**Residual Activity:** Essentially none.

**Unique Characteristics:** Preplant tillage to break up rhizomes will improve control of quackgrass. Except as noted on the label, apply broadleaf herbicides separately at least 3 days after fluazifop-p-butyl. Do not cultivate for 5 days after applying fluazifop-p-butyl. When plants are stressed (lack of moisture, excessive humidity, low temperature and/or very low relative humidity), fluazifop-p-butyl is less effective. Regrowth by tillering may occur if application is made under any of the above conditions. Since there is no residual activity, a new flush of weeds may emerge after the first flush has been controlled.

## FLUMETSULAM

**Trade Name:** BROADSTRIKE RC.

**Chemical Family:** Triazolopyrimidine sulfonanilide.

**Crop and/or Non-Crop Registrations:** Soybeans.

**Sensitive Weeds:** Common lamb's-quarters, redroot pigweed, eastern black nightshade, and velvetleaf are controlled. Cocklebur, green foxtail, and lady's thumb are suppressed.

**Uptake and Translocation:** Flumetsulam is absorbed by both roots and shoots of germinating broadleaf weeds.

**Basis of Selectivity:** Selectivity of flumetsulam in soybeans is based on metabolism.

**Application Methods:** Surface preplant, preplant incorporated or preemergence.

**Residual Activity:** The most significant means of dissipation of flumetsulam is microbial degradation. Provides season-long residual control of annual broadleaf and grass weeds. Rotational crops are winter wheat, spring wheat, spring barley, soybeans, common beans (dry, snap), lima beans, peas, field corn, seed corn.

**Unique Characteristics:** Can be applied up to 21 days before planting. Rainfall within 7–10 days is required for maximum activity of a preemergence application. Do not apply to areas where the soil pH is more than 7.8 and organic matter is less

than 2%. Do not apply to soils containing more than 5% organic matter. Suspension concentrate formulation separates into 2 phases over time. Shake container well before using.

## FLUMIOXAZIN

**Trade Name:** BROADSTAR, CHATEAU, PAYLOAD, SUREGUARD, VALTERA.

**Chemical Family:** Dicarboxamide.

**Crop and/or Non-Crop Registrations:** Dry bulb onion, potato, pome fruit (apple and pear), grape, strawberry, highbush blueberry, stone fruit (peach, cherry, nectarine, plum and apricot), asparagus, field-grown woody ornamentals, soybeans, edible bean desiccant, and non-crop areas.

**Sensitive Weeds:** Hairy bittercress, liverwort, pigweed spp., common ragweed, lamb's-quarters, hairy nightshade, eastern black nightshade. Suppression of green foxtail, common groundsel and common chickweed.

**Uptake and Translocation:** Primarily taken up by the roots of treated plants following soil applications. Movement in the phloem is limited because of the rapid foliar desiccation caused by the herbicide.

**Application Methods:** See label for specific timing in each registered crop. In general, flumioxazin must be applied prior to weed emergence.

**Residual Activity:** Generally will provide 4–6 weeks of broadleaf weed control, however the length of residual control is dependent on application rate, rainfall and temperature conditions following application.

**Unique Characteristics:** Flumioxazin is a soil applied herbicide providing residual control of annual broadleaf weeds and suppression of grassy weeds. Moisture is necessary for effective residual weed control. Dry weather following applications of flumioxazin may reduce effectiveness. Flumioxazin will not control emerged weeds and may not control weeds that germinate after application but before an activating rainfall or weeds that

germinate through cracks resulting from dry soil. Disturbing soil surfaces may reduce efficacy.

## FLUROXYPYR

**Trade Name:** TROPHY A.

**Chemical Family:** Pyridine.

**Crop and/or Non-Crop Registrations:** Winter wheat.

**Sensitive Weeds:** Cleavers, kochia, round-leaved mallow, volunteer flax. Suppression of chickweed, hempnettle, stork's bill and wild buckwheat.

**Application Methods:** Postemergence from the 3 leaf to flag leaf stage of winter wheat.

**Residual Activity:** Half life ranges from 11–38 days. Fluroxypyrr provides very little residual weed control.

**Unique Characteristics:** This product was specifically brought to the Ontario marketplace for the control of cleavers in winter wheat. TROPHY A is one component of the TROPHY co-pack, the second component is TROPHY B (MCPA). Field experience has shown that it also provides suppression of tufted vetch, an increasingly problematic species in Ontario.

## FOMESAFEN

**Trade Name:** REFLEX.

**Chemical Family:** Diphenyl ether.

**Crop Registrations:** Soybeans, and is registered for use on a number of different edible bean market classes, refer to Table 7-1. Beans (*Adzuki, Dry, Lima and Snap*) Weed Control Ratings, page 97 for specific crop registrations.

**Sensitive Weeds:** Redroot pigweed, common ragweed, wild mustard, lady's thumb, eastern black nightshade, cocklebur; suppression of velvetleaf, lamb's-quarters, tall waterhemp.

**Uptake and Translocation:** Taken up through foliage. Not readily translocated.

**Mode of Action:** Cell-membrane disrupter.

**Method of Selectivity:** Beans metabolize fomesafen.

Some initial bronzing of crop leaves may occur, but plants normally outgrow this condition without any effect on maturity or yield.

**Application Method:** Early postemergence to weeds and crop. Apply when beans are 1–2 trifoliate and weeds are at the 2–4 leaf stage. Good coverage is essential for optimum weed control. Apply in 200–350 L of water/ha at a pressure between 245–420 kPa. Always add an adjuvant such as AGRAL 90 (0.25% v/v) or TURBOCHARGE (0.5% v/v). PINNACLE or VENTURE may be tank-mixed for additional weed control.

**Residual Activity:** Persistence depends on weather and soil conditions (more persistent under dry conditions). Rotation to field corn, dry beans or soybeans the following year. Winter wheat may be planted 90 days after treatment. All other crops require a field bioassay.

**Unique Characteristics:** Do not apply REFLEX to any field more than once every 2 years.

## FORAMSULFURON

**Trade Name:** OPTION 2.25 OD.

**Chemical Family:** Sulfonylurea.

**Crop and/or Non-Crop Registrations:** Field Corn.

**Sensitive Weeds:** Quackgrass, green, yellow and bristly foxtail, fall panicum, proso millet, barnyard grass, witchgrass, large crabgrass, redroot pigweed, common lamb's-quarters, velvetleaf, eastern black nightshade, common chickweed, wild and wormseed mustard.

**Uptake and Translocation:** Foramsulfuron is quickly absorbed through leaves and rapidly translocated throughout the plant.

**Basis of Selectivity:** Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants.

Tolerant species rapidly metabolize foramsulfuron.

**Application Methods:** Postemergent from the 1–8 leaf stage of corn, emerged grassy weeds up to the early tillering stage, emerged broadleaf weeds.

**Residual Activity:** Essentially none.

**Unique Characteristics:** Addition of the safener isoxadifen in the formulated product maximizes crop tolerance, enhances crop recovery under severe environmental conditions and allows the use of an ethylated/methylated seed oil based adjuvant system.

## FOSAMINE AMMONIUM

**Trade Name:** KRENITE.

**Chemical Family:** Carbamoyl phosphonate.

**Crop and/or Non-Crop Registrations:** Vine and brush control on non-cropland.

**Sensitive Weeds:** Blackberry, oak, pine, sumac, maple, elder, elm, wild rose, hazel, aspen and beech. Cedar and spruce are quite tolerant.

**Uptake and Translocation:** Absorption by young stems and foliage. Translocation has been observed from a treated mature leaf to all other parts of a plant but phloem transport with sugars is predominant.

**Basis of Selectivity:** Not highly selective.

**Application Methods:** Postemergence. Apply with high pressure ground equipment to ensure penetration of spray to thoroughly wet leaves, buds, stems and trunks of target brush. Surfactants are recommended to promote rapid leaf penetration.

**Residual Activity:** Essentially none.

**Unique Characteristics:** Woody plants treated with fosamine ammonium die very slowly; the stems may not be completely killed 2 years after treatment; the unsightly brown-out effect common to many other herbicides does not occur. Rainfall within 24 hours of application may decrease effectiveness.

## FUMIGANTS

See METAM SODIUM, page 57.

## GLUFOSINATE AMMONIUM

**Trade Name:** IGNITE, LIBERTY 200SN.

**Chemical Family:** Unique.

**Crop and/or Non-Crop Registrations:** IGNITE – Desiccation of dry beans; directed applications in apples, highbush blueberries, sweet and sour cherries, grapes, peaches, pears and plums; stale seedbed techniques in asparagus, carrots, lettuce and onions; ground crack application in potatoes. LIBERTY 200SN – Corn hybrids, soybean and canola varieties specially developed to be tolerant to Liberty 200SN herbicide. Glufosinate-ammonium tolerant inbred lines grown for seed corn production.

**Sensitive Weeds:** Non-selective – affects all actively growing green plants; regrowth of perennial species may occur.

**Uptake and Translocation:** Absorbed through foliage; minimal translocation – dependent on application rate and species treated.

**Basis of Selectivity:** IGNITE – All green plant tissue is sensitive; safe on mature (non-green) bark of woody plants. LIBERTY 200SN – All green plant tissue is sensitive except for field corn, seed corn, soybeans and canola plants that have been specially developed to be tolerant.

**Application Methods:** IGNITE – Postemergence; broadcast or directed spray to avoid contact with leaves or green bark of desirable plants; thorough coverage of the plant tissue to be controlled is essential. LIBERTY 200SN – Postemergence. Can be broadcast in "Liberty Link" corn at the 1–8 leaf stage, apply with drop nozzles to later corn growth stages; cotyledon to flowering stage in "Liberty Link" soybeans and cotyledon to early bolting stage in InVigor canola.

**Residual Activity:** None; there are no cropping or rotational restrictions after application.

**Unique Characteristics:** Speed of action is influenced by environmental factors; at cool temperatures, poor moisture and low humidity, speed of action

may be reduced. Heavy dew at time of application may reduce control of certain weed species.

## GLYPHOSATE

**Trade Names:** CATENA HERBICIDE, CREDIT 45, CREDIT PLUS, CREDIT XTREME EZJECT, FACTOR, FACTOR 540 GLYPHOSATE, FORZA SILVICULTURAL HERBICIDE, GLYFOS, MPOWER, MATRIX, MAVERICK III, POLARIS, RENEGADE, RENEGADE HC, ROUND-UP ULTRA 2, ROUNDUP WEATHERMAX, SHARPSHOOTER, SHARPSHOOTER PLUS, TOUCHDOWN TOTAL, TRAXION, VANTAGE, VANTAGE FORESTRY HERBICIDE, VANTAGE PLUS MAX II, VISION SILVICULTURE, VISION MAX SILVICULTURE, VANTAGE XRT, WISE-UP.

**Chemical Family:** Amino acid.

**Crop and/or Non-Crop Registrations:** Preplant or postharvest with no cropping restrictions. Preharvest in wheat, barley, soybeans, canola, flax, lentils, peas and forages. "Roundup Ready" Crops – refer to Table 4-3, *Glyphosate Products, Registered Uses and Rates Needed to Control Specific Weed Species in Glyphosate Tolerant Crops*, page 69. Directed applications in ginseng, cherries, grapes, apples, pears, plums and peaches, strawberries as wiper or spot treatment. Non-crop registrations: Brush control; turf renovation; chemical mowing; directed application in woody nursery stock, roadsides and shelterbelts. E-Z-JECT – Selective woody brush and tree control. CATENA HERBICIDE, FORZA SILVICULTURAL HERBICIDE, VANTAGE FORESTRY HERBICIDE, VISION, VISION MAX – Silvicultural site preparation, conifer release, forest tree plantings, forest tree nurseries.

**Sensitive Weeds:** Annual grasses; perennial weeds (quackgrass, Canada thistle, sow-thistle, field bindweed, milkweed, cattails, nutsedge, poison-ivy)

etc.); brush (birch, alder, poplar, raspberry, willow and maple).

**Uptake and Translocation:** Absorbed through foliage and translocated throughout the plant.

**Basis of Selectivity:** Non-selective for agricultural crops. Conifers are tolerant at some stages but the basis has not been established.

**Application Methods:** Postemergence, usually at the bud to bloom stage of growth for most perennial weeds. Canada thistle should be at least in early flower bud, milkweed at flower bud and bindweed at full flower. Quackgrass can be treated in the spring or fall when it is actively growing with at least 3–4 new leaves on each emerged shoot; in the fall, remove crop refuse but do not till prior to application; fall or spring tillage prior to spring application may reduce control; wait at least 3–5 days after application before working the area; for maximum control it is advisable to till before the quackgrass turns completely brown. Glyphosate can be applied with boom equipment, knapsack sprayers and high-volume equipment for agricultural and non-crop uses. Backpack mist blowers may be used for silvicultural site preparation and roadside brush control only. Aerial applications may be used for silvicultural site preparation and conifer release only. Can also be applied with selective equipment for non-crop areas, tree plantings, grapes and orchards (See *Preplant Weed Control*, page 90 and *Wick Wiper and Roller Application*, page 96). Regardless of method of application, do not allow herbicide solution to contact green foliage or green bark of crop or other desirable plants; remove all suckers from the trunks of desirable trees before spraying.

**Residual Activity:** None – crops can be planted or seeded directly into treated areas following application. Other herbicides are required to control weeds emerging after the application.

**Unique Characteristics:** Rainfall within 6 hours after application or heavy frost within 24 hours

may reduce control for 356 g/L formulations. 360 g/L formulations are rainfast as soon as 4 hours after application. ROUNDUP ULTRA 2, ROUNDUP WEATHERMAX, FACTOR 540 and TOUCHDOWN TOTAL are rainfast as soon as 1 hour after application.

## GLYPHOSATE/MESOTRIONE/ S-METOLACHLOR/BENOXACOR

**Trade Name:** HALEX GT.

**Chemical Family:** Amino acid, triketone and acetanalide.

**Crop and/or Non-Crop Registrations:** Glyphosate tolerant ("Roundup Ready") corn only.

**Sensitive Weeds:** Emerged annual grass and broadleaf weeds controlled by glyphosate and residual control of unemerged annual grass and broadleaf weeds (see residual activity for specific species).

**Uptake and Translocation:** Refer to glyphosate, meostriione and s-metolachlor/benoxacor.

**Basis of Selectivity:** Refer to glyphosate, meostriione and s-metolachlor/benoxacor.

**Application Methods:** Postemergence from the spike to 6 leaf stage of glyphosate tolerant corn.

**Residual Activity:** HALEX GT will provide residual control of eastern black nightshade, lady's thumb, lamb's-quarters, pigweed spp. mustard (wild), velvetleaf, barnyardgrass, crabgrass (smooth and large), fall panicum, foxtails (green, yellow and giant), witchgrass.

## HEXAZINONE

**Trade Names:** PRONONE, VELPAR.

**Chemical Family:** Triazine.

**Crop and/or Non-Crop Registrations:** Christmas trees, coniferous reforestation, non-cropland.

**Sensitive Weeds:** Most herbaceous broadleaf weeds and grasses including raspberry, bluejoint grass, goldenrod and brome grass; spot applications control aspen, ash, maple, cherry and birch.

**Uptake and Translocation:** Absorbed through roots and foliage; translocation is primarily upwards through xylem.

**Basis of Selectivity:** Tolerant species metabolize hexazinone faster than sensitive species. For conifers, at least part of the selectivity is due to the tree roots being deeper than hexazinone leaches into the soil.

**Application Methods:** For broadcast applications, apply preemergence or as a postemergence foliar spray during active plant growth. For spot applications, use an exact-delivery hand gun applicator to apply undiluted VELPAR as close as possible to the root collar of plants to be controlled; keep spots at least 1 m away from desirable conifers. Apply PRONONE with an approved granular applicator.

**Residual Activity:** Half-life of 2 months on a Flanagan silt loam in Illinois. Half-life of 2½ months on a silty clay in Northern Ontario.

**Unique Characteristics:** Rainfall is needed to activate hexazinone in the soil. Do not use on sandy, gravelly or rocky soils, or on frozen ground. Do not apply on steep slopes. Do not apply to areas where the roots of desirable trees may extend. Liquid formulation is flammable. A bioassay may be used to determine soil residue levels when sensitive crops are to be planted in soil treated with hexazinone.

## IMAZAPYR

**Trade Name:** ARSENAL.

**Chemical Family:** Imidazolinone.

**Crop and/or Non-Crop Registrations:** Non-crop/non-graze areas such as boreal forests, industrial sites, railroad ballast, spot treatments for rail and highway rights-of-way and pipeline rights-of-way stations including well sites, battery stations and compressor or valve stations.

**Sensitive Weeds:** Annual and perennial grass and broadleaf weeds such as: annual – black medick, rough cinquefoil, common groundsel, hemp-nettle,

kochia, lamb's-quarters, mustard spp., pigweed spp., pineappleweed, ragweed spp., Russian thistle, stinkweed, annual sow-thistle, wild buckwheat, annual bluegrass, foxtail spp., witchgrass; biennial/perennial – bladder campion, bull thistle, burdock, Canada thistle, sulfur cinquefoil, clover spp., dandelion, dog-strangling vine, field bindweed, goat's beard, goldenrod, leafy spurge, milkweed, mouse-eared chickweed, mullein spp., ox-eye daisy, plantain spp., poison-ivy, sheep sorrel, toadflax, tufted vetch, wild carrot, wild grape, wild strawberry, brome grass, Canada bluegrass, fescue spp., quackgrass, yellow nutsedge; seedling woody species – maple, poplar, raspberry and wild rose.

**Uptake and Translocation:** Absorbed by both roots and foliage of sensitive vegetation. Translocated in both the xylem and phloem.

**Basis of Selectivity:** None.

**Application Methods:** Postemergence on actively growing weeds. Control of non-emerged sensitive species will also be provided in the year of application. Apply in 100–550 L of water/ha with high-volume, high-pressure handguns and vehicle-mounted directed-spray equipment or conventional boom-mounted, manifold-mounted or off-centred nozzles. Low-volume, hand-held backpacks, knapsacks or other pump-up-type sprayers may also be used for direct applications to foliage. Addition of non-ionic surfactant at 1 L/400 L of spray solution is recommended for spray volumes greater than 550 L/ha. A foam-reducing agent may be added at the recommended rate, if required.

**Residual Activity:** Season-long control of sensitive species.

**Unique Characteristics:** Do not contaminate ponds, lakes, streams, wetlands or sloughs and do not apply within 15 m of a wetland area or body of water. Do not mix or store in unlined steel (except stainless steel) containers or spray tanks. For ground application only. Do not use where roots from desirable vegetation may extend into the

treated area (maintain a distance from desirable trees equal to at least twice the distance from the trunk to the dripline). To be used by licensed applicators only.

## IMAZETHAPYR

**Trade Name:** CONQUEST B (Available only in CONQUEST LQ co-pack), PHANTOM, PURSUIT.

**Chemical Family:** Imidazolinone.

**Crop and/or Non-Crop Registrations:** Soybeans, a number of different edible bean market classes, refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97 for specific crop registrations, Clearfield corn, Clearfield canola processing peas, snow peas and alfalfa for seed production.

**Sensitive Weeds:** Soil applications – green foxtail, yellow foxtail, witchgrass, barnyard grass, lamb's-quarters, redroot pigweed, smartweed, lady's-thumb, wild mustard, velvetleaf, common ragweed and reduced competition from eastern black nightshade and proso millet. Postemergence application – green foxtail, yellow foxtail, witchgrass, barnyard grass, redroot pigweed, velvetleaf, wild mustard, cocklebur, eastern black nightshade, ragweed and reduced competition from proso millet, large crabgrass, lamb's-quarter's, wild buckwheat and yellow nutsedge. Late postemergence application – green and yellow foxtail (up to 4 leaf stage), barnyard grass (up to 6 leaf stage), redroot pigweed (up to 12 leaf stage) and velvetleaf (up to 8 leaf stage), giant ragweed (up to 6 leaf stage).

**Uptake and Translocation:** Absorbed by both roots and foliage. Translocation in both xylem and phloem.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Early preplant (up to 30 days before planting), preplant incorporated,

preemergence and postemergence up to the 2 leaf stage of weeds.

**Residual Activity:** Persistence depends on weather and soil conditions (more persistent under dry conditions). Some rotational restrictions apply, refer to Tables 4-4 and 4-5. *Herbicide Crop Rotation and Soil pH Restrictions*, page 70 and page 72, for more information.

**Unique Characteristics:** Can be applied up to 30 days prior to planting. Registered for use in reduced and no-till situations. Tank-mixing is recommended for heavy infestations of ragweed or barnyard grass. Postemergence application requires the addition of AGRAL 90, AGSURF or ENHANCE surfactant and liquid fertilizer solution. Temporary soybean discoloration and/or shortening may occur with postemergence applications. A period of 100 days is required between application and planting winter wheat.

### IMAZETHAPYR + BENTAZON

**Trade Name:** CLEANSWEEP (co-pack of PURSUIT + BASAGRAN FORTÉ).

**Chemical Family:** Imidazolinone + benzothiadiazine.

**Crop and/or Non-Crop Registrations:** Soybeans.

**Sensitive Weeds:** Annual grass (barnyard grass, green and yellow foxtail) and broadleaf (cocklebur, flower-of-an-hour, lady's-thumb, lamb's-quarters, pigweed, ragweed, shepherd's-purse, stinkweed, velvetleaf, wild mustard, eastern black nightshade) species including triazine resistant biotypes and reduced competition from yellow nutsedge, Canada thistle and field bindweed.

**Uptake and Translocation:** Contact and systemic. Absorption occurs through foliage and roots.

**Basis of Selectivity:** Metabolism by soybeans.

**Application Methods:** Postemergence.

**Unique Characteristics:** A liquid ammonium fertilizer solution (such as UAN) must be added at 2 L/ha. Some rotational restrictions apply. See label for details. Refer to notes on IMAZETHAPYR and

BENTAZON for additional information on each component.

### IMAZETHAPYR + METRIBUZIN

**Trade Name:** CONQUEST LQ (co-pack of CONQUEST A + CONQUEST B).

**Chemical Family:** Imidazolinone + s-triazine.

**Crop and/or Non-Crop Registrations:** Soybeans.

**Sensitive Weeds:** Annual grass and broadleaf species. See label for specific species controlled.

**Application Methods:** Early preplant incorporated and preemergence.

**Unique Characteristics:** Some rotational restrictions apply. See label for details. Refer to notes on imazethapyr and metribuzin for additional information on each component.

### INDAZIFLAM

**Trade Name:** ALION 200 SC.

**Chemical Family:** Alkylazine.

**Crop and/or Non-Crop Registrations:** Apples, apricots, cherries, plums, peaches, pears.

**Sensitive Weeds:** Barnyard grass, giant foxtail, green foxtail, Italian ryegrass, large crabgrass, wild proso millet, yellow foxtail, annual sow-thistle, black mustard, common groundsel, field bindweed, lamb's-quarters, prickly lettuce (suppression only), redroot pigweed (suppression only), shepherd's purse, spotted spurge, stork's-bill, white sweetclover, wild mustard.

**Uptake and translocation:** Absorbed by roots of germinating weeds. Rain or irrigation is necessary for activation. Best control is achieved if received within 3 weeks after application.

**Basis of Selectivity:** Established roots and roots below level of ALION in soil.

**Application Methods:** Pre-emergent to weeds. Apply to established crops of at least three full growing seasons. Applied alone, ALION will not control weeds that are already emerged.

**Unique Characteristics:** ALION is a residual product.

If there is heavy weed pressure, emerged weeds will tie up the ALION, reducing residual herbicide activity. In the case of heavy weed infestation and very little bare ground, apply a burndown product alone, then once the weeds have died or shrivelled – apply ALION alone **ONLY** if you are confident there are no emerged weeds at the time of application **OR** apply ALION in tank-mix with a burndown to control any small emerged weeds.

### ISOXAFLUTOLE + ATRAZINE

**Trade Name:** CONVERGE XT (co-pack CONVERGE FLEXX + CONVERGE 480), or tank-mix of CONVERGE FLEXX + atrazine 480.

**Chemical Family:** Isoxazole + s-triazine.

**Crop and/or Non-Crop Registrations:** Corn, field.

**Sensitive Weeds:** Annual grasses and broadleaf weeds including triazine and ALS inhibitor tolerant biotypes: green, yellow and giant foxtail, barnyard grass, witchgrass, large and smooth crabgrass, lamb's-quarters, pigweed, common ragweed, eastern black nightshade, velvetleaf, wild mustard, wormseed mustard, wild buckwheat, lady's-thumb, seedling dandelion and seedling plantain.

**Uptake and Translocation:** Absorbed by roots and shoots of germinating weeds.

**Basis of Selectivity:** Metabolized by tolerant species.

Preemergence and early postemergence up to the 3 leaf stage of corn. Provides season long weed control. Winter wheat can be grown 4 months after application, corn, soybeans, spring cereals, alfalfa, spring canola and processing peas can be grown the following year. Weed seedlings that emerge prior to activation of herbicide by rainfall can be controlled if less than 5 cm in height. **NOT** for use on sandy loam or finer textured soils with a minimum of 2% organic matter.

## **ISOXABEN**

**Trade Name:** GALLERY.

**Chemical Family:** Benzamide.

**Crop and/or Non-Crop Registrations:** Bareroot and container conifer seedlings.

**Sensitive Weeds:** St. John's-wort, pineappleweed, lamb's-quarters, purslane, shepherd's-purse, low cud-weed and purslane speedwell.

**Uptake and Translocation:** Absorbed by roots and translocated to the shoots of germinating weeds.

**Basis of Selectivity:** Root selectivity.

**Application Methods:** Applied prior to weed emergence in conifers, 4 or more weeks after crop germination and emergence. Rainfall or irrigation is needed to activate the herbicide.

**Residual Activity:** Provides season-long control.

Germination of some sensitive crop species may be reduced in the year following treatment.

**Unique Characteristics:** Gallery is registered for use only by members of the Canadian Forest Nursery Weed Management Association.

## **LINURON**

**Trade Name:** LOROX DF, LOROX L.

**Chemical Family:** Substituted urea.

**Crop and/or Non-Crop Registrations:** Corn, soybeans, carrots, celery, dill, parsnips, potatoes, asparagus, caraway, coriander, sweet white lupins, wheat, oats, barley, gladioli, fruit trees.

**Sensitive Weeds:** Annual weeds such as barnyard grass, common chickweed, corn spurry, crabgrass, velvetleaf, fall panicum, foxtail, goosefoot, goose grass, groundsel, knotweed, lamb's-quarters, redroot pigweed, purslane, common ragweed, shepherd's-purse, smartweed, stinkweed, wild buckwheat, witchgrass, wormseed mustard, triazine-resistant weeds; seedlings only of dandelion, plantain and sow-thistle.

**Uptake and Translocation:** Readily absorbed through roots, less so through foliage; translocation primarily upwards in xylem.

**Basis of Selectivity:** Differential metabolism often coupled with differential uptake and translocation.

**Application Methods:** Preemergence, postemergence, directed postemergence, pre plus postemergence.

**Residual Activity:** Does not pose a problem for subsequent crops since phytotoxic residues from applications at agricultural rates disappear within 4 months.

**Unique Characteristics:** Do not use on sandy or coarse-textured soils having less than 2% organic matter. If unusually heavy rains follow application, severe injury may occur to corn, soybeans, carrots and potatoes.

## **MCPA**

**Trade Names:** MCPA ESTER 600, MCPA ESTER 500, MCPA SODIUM 300, MCPA AMINE 500, MCPA AMINE 600, REFINE M (co-pack of MCPA + REFINE SG) TROPHY B.

**Chemical Family:** Phenoxy.

**Crop and/or Non-Crop Registrations:** Cereal crops, turf, non-crop sites.

**Sensitive Weeds:** Many broadleaf weeds, especially buttercup, hemp-nettle, field horsetail (top growth only), seedling dock.

**Uptake and Translocation:** Absorbed through leaves or roots. Translocates to, and accumulates at, growing points of shoots and roots.

**Basis of Selectivity:** Differences in interception, penetration, translocation, metabolism and sensitivity of active sites leads to greater activity in broadleaf weeds than grasses.

**Application Methods:** Postemergence.

**Residual Activity:** Some soil residues can be detected for up to 1 month under moist conditions and 6 months in drier climates.

**Unique Characteristics:** MCPA is available in amine ester or sodium salt formulations. It is safer than 2,4-D for use on oats, flax and peas. As with 2,4-D, there is a potential drift hazard to nearby

susceptible crops such as grapes, turnips, tobacco and cabbage.

## **MCPB/MCPA**

**Trade Name:** CLOVITOX PLUS, TOPSIDE, TROPOTOX PLUS.

**Chemical Family:** Phenoxy/phenoxy.

**Crop and/or Non-Crop Registrations:** Seedling white, ladino, alsike or red clovers direct seeded or underseeded in wheat, oats, barley, rye, pastures, field corn, peas, grapes (not TOPSIDE).

**Sensitive Weeds:** Small emerged mustards, stinkweed, ragweed, lamb's-quarters, redroot pigweed, shepherd's-purse, volunteer rapeseed, wild radish, hemp-nettle, annual sow-thistle; top-growth control of bull thistle, Canada thistle, curled dock, plantain, perennial sow-thistle, field bindweed, horsetail, buttercup.

**Uptake and Translocation:** Absorbed through the foliage and readily translocated, especially to the growing points.

**Basis of Selectivity:** MCPB is not directly toxic to plants. Susceptible weeds convert MCPB to MCPA.

**Application Methods:** Postemergence. In cereals, clovers and peas, apply as an overall spray. In corn, apply with drop pipes after the corn reaches 45 cm before the beginning of tasselling. Apply to pastures after grazing or cutting.

## **MECOPROP-P**

**Trade Names:** COMPITOX, MECOPROP.

**Chemical Family:** Phenoxy.

**Crop and/or Non-Crop Registrations:** Cereals, turf.

**Sensitive Weeds:** Many broadleaf weeds such as chickweed, cleavers, plantain, clover, corn spurry, stitchwort, black medick, knotweed, shepherd's-purse, buttercup, Canada thistle (top-growth control) and dandelion. For complete control of Canada thistle, dandelion and black medick, a repeat application will likely be required.

**Uptake and Translocation:** Absorbed readily by foliage and translocated to roots and throughout shoots, especially to growing points.

**Basis of Selectivity:** Differences in interception, penetration, translocation, metabolism and sensitivity of active sites result in broadleaf species being more sensitive than grasses.

**Application Methods:** Postemergence. Apply to cereals between the 3 leaf and early flag-leaf stage. In turf, apply when weeds are actively growing.

**Residual Activity:** Can persist in soil up to 4 weeks, however, grass can normally be seeded within 1–2 weeks after treatment.

**Unique Characteristics:** Controls 2,4-D-resistant weeds such as chickweed, clovers, black medick and young knotweed. Do not spray on grain underseeded to legumes. If cereals are stressed at the time of application, deformed heads and missing florets may result. Can be safely used on bentgrass, however, injury may occur if temperature is above 27°C. Effectiveness will be reduced if rain occurs within 4–6 hours after treatment.

## MECOPROP-P/2,4-D

**Trade Names:** IPCO PREMIUM 2-WAY XP TURF HERBICIDE, MECOTURF PLUS 2,4-D, TURF-RITE 2+2.

**Chemical Family:** Phenoxy/phenoxy.

**Crop and/or Non-Crop Registrations:** Turf.

**Sensitive Weeds:** Many broadleaf weeds such as chickweed, cleavers, plantain, clover, corn spurry, stitchwort, black medick, knotweed, shepherd's-purse, buttercup, Canada thistle (top-growth control) and dandelion.

**Uptake and Translocation:** Absorbed through leaves and roots, translocates to growing points.

**Basis of Selectivity:** Differences in interception, penetration, translocation, metabolism and sensitivity of active sites result in broadleaf species being more sensitive than grasses.

NOTES ON HERBICIDES: MECOPROP-P/2,4-D

**Application Methods:** Postemergence. Apply when weeds are actively growing.

## MESOTRIONE

**Trade Name:** CALLISTO.

**Chemical Family:** Triketone.

**Crop and/or Non-Crop Registrations:** Corn (field, seed and sweet), highbush blueberries, cranberries.

**Sensitive Weeds (when tank-mixed with atrazine):**

Cocklebur (emerged), common ragweed, giant ragweed (emerged), lamb's-quarters, redroot pigweed, tall waterhemp, velvetleaf, volunteer adzuki bean (emerged).

**Uptake and Translocation:** Readily absorbed by, shoots, roots, stems and leaves and then translocated to other plant parts.

**Basis of Selectivity:** Inhibits the HPPD enzyme found in photosynthetic cells of susceptible species. Symptoms on susceptible plants are bleaching followed by necrosis. Tolerant species rapidly metabolize mesotrione.

**Application Methods:** Preemergence and postemergence up to the 8 leaf stage of field, seed and sweet corn. Postemergence applications to corn require the addition of a non-ionic surfactant. Apply to blueberries and cranberry beds preemergence and postemergence to weeds.

**Residual Activity:** Degradation primarily by soil microbial action. Mesotrione will provide residual control of annual broadleaf weeds.

**Unique Characteristics:** When mesotrione is tank-mixed with atrazine there is a synergistic effect and improved control of broadleaf weed species. Mesotrione can be tank-mixed with either a soil applied or postemergence grass herbicide for one-pass weed control. Mesotrione has low volatility and poses a reduced risk to nearby sensitive crops.

## METAM SODIUM

**Trade Name:** VAPAM.

**Chemical Family:** Thiocarbamate.

**Crop and/or Non-Crop Registrations:** Field and greenhouse seedbeds. Field-replant sites of fruits, vegetables, tobacco, ornamentals and forest-tree stock.

**Sensitive Weeds:** Most scarified weed seeds and freshly vegetative parts including rhizomes and germinating seedlings.

**Basis of Selectivity:** Most plant parts are sensitive.

Crops are not planted until all fumigant has dissipated from the soil. With moisture, methyl isothiocyanate gas is released, which kills most scarified seeds and fleshy vegetative parts including rhizomes and germinating seedlings.

**Application Methods:** Apply uniformly using injectors, water or other incorporation tools to carry the product to the desired soil depth. May be applied via the irrigation system. No gas-proof cover is required unless the soil is very porous, however, a sprinkler application of water should be used to provide a surface "water seal".

**Residual Activity:** 10–40 days depending on soil temperature and the amount of organic matter present in the soil. Persistence is greatest at low temperatures and high levels of organic matter. Planting may take place 12–16 days after the treatment and following a lettuce-seedling bioassay that indicates no injury.

**Unique Characteristics:** Also controls nematodes, soil fungi and soil insects. All traces of toxic gases must be dissipated from the treated soil before planting or plant injury may occur.

## METOLACHLOR

See S-METOLACHLOR, page 64.

## METOLACHLOR/ATRAZINE

See S-METOLACHLOR/ATRAZINE, page 64.

## METRIBUZIN

**Trade Names:** CONQUEST A (Available only in CONQUEST LQ co-pack), SENCOR 480 F, SENCOR 500 FLOWABLE, SENCOR 75 DF.

**Chemical Family:** S-triazine.

**Crop and/or Non-Crop Registrations:** Apples, apricots, asparagus, (established), blueberries (highbush), carrots (processing) cherries, corn (field), faba beans, peaches, plums, potatoes, soybeans and transplant tomatoes.

**Sensitive Weeds:** Lamb's-quarters, wild mustard, redroot pigweed, common ragweed, shepherd's-purse, lady's-thumb, velvetleaf, jimsonweed, prostrate pigweed, Russian thistle, yellow wood-sorrel, prickly mallow, chickweed, cocklebur, carpetweed, dandelion seedlings, barnyard grass, crabgrass, foxtail, fall panicum, witchgrass, Johnson grass seedlings and cheat grass.

**Uptake and Translocation:** Some uptake through the foliage but the major route is via the roots. Translocation upwards in the xylem.

**Basis of Selectivity:** Degradation by tolerant species.

**Application Methods:** Preplant incorporated (potatoes, soybeans, apples, apricots, peaches, cherries, pears, plums, corn, and tomatoes); preemergence (asparagus, potatoes, soybeans apples, apricots, blueberries, cherries, peaches, pears, plums); postemergence (potatoes, tomatoes, corn).

**Residual Activity:** Varies with the climate. At normal-use rates the half-life is 1–2 months.

**Unique Characteristics:** Heavy rainfall following application may cause crop damage. Some varieties of potato, soybean and tomato are less tolerant than others. Triazine-resistant weeds are not controlled. Do not use on muck soils.

## METRIBUZIN + S-METOLACHLOR

**Trade Name:** BOUNDARY (co-pack of SENCOR DF SOYBEAN + DUAL MAGNUM SOYBEAN).

**Chemical Family:** S-triazine+Acetanilide.

**Crop and/or Non-Crop Registrations:** Soybeans.

**Sensitive Weeds:** Annual grass and broadleaf species.

See label for specific species controlled.

**Application Methods:** Preplant incorporated and preemergence.

**Unique Characteristics:** Refer to notes on s-metolachlor and metribuzin for additional information on each component.

## NAPROPAMIDE

**Trade Names:** DEVRINOL 50 DF, DEVRINOL 2G, DEVRINOL 10G.

**Chemical Family:** Amide.

**Crop and/or Non-Crop Registrations:** Asparagus, cole crops (cabbage, broccoli, cauliflower, Chinese broccoli, Chinese mustard greens, Chinese Nappa cabbage, Chinese radish), garlic, kohlrabi, peppers, pumpkin, squash, fuzzy squash, rutabagas, tomatoes, tobacco, raspberries, blackberries, cultivated lowbush blueberries, established highbush blueberries, boysenberries, cranberries, loganberries, newly planted or established strawberries, apples, grapes, peaches and pears, newly transplanted or established ornamentals, woody nursery stock, forest tree stock, ground covers and container-grown ornamentals (see label for species). Apply with simazine or with terbacil on new plantings of apples, apricots, cherries, plums, peaches and pears.

**Sensitive Weeds:** Many annual weeds including crabgrass, barnyard grass, annual bluegrass, foxtails, sandbur, wild oats, goose grass, chickweed, groundsel, redroot pigweed, lamb's-quarters, purslane, prostrate knotweed, pineappleweed and prickly lettuce.

**Uptake and Translocation:** Absorbed through the roots of germinating weeds. Translocated upward through seedling.

**Basis of Selectivity:** Metabolized by tolerant species. Root growth of germinating seedlings is inhibited. Established plants are not affected due to placement selectivity.

**Application Methods:** May be applied preplant incorporated using water as the carrier. Incorporation should be uniform, and to a chemical depth of 2.5–5 cm, using irrigation or proper incorporation equipment (e.g., tandem discs or field cultivator with sweep teeth) followed by a levelling device. On established crops, apply to a weed-free soil surface and irrigate if no rainfall occurs within 7 days after application in spring or fall, or within 2 days after application in summer; irrigate with sufficient water to wet the soil to a depth of 5–10 cm (approximately 7 mm of rain). For post-plant application in tobacco, apply in 25 cm band over the row. Cross-disc or cross-plough after harvest to dilute soil residue before planting cover crop.

**Residual Activity:** Provides season-long weed control if properly incorporated. Deep ploughing will minimize any carryover effect.

**Unique Characteristics:** Will not control germinated weeds. Resists leaching. To avoid injury to crops not registered for use with napropamide, do not plant until 12 months after the last napropamide application.

## NICOSULFURON

**Trade Name:** ACCENT.

**Chemical Family:** Sulfonylurea.

**Crop and/or Non-Crop Registrations:** Field corn, certain varieties of sweet corn (refer to product label), and seed corn (contact seed source for details on specific inbreds).

**Sensitive Weeds:** Quackgrass, proso millet, green and yellow foxtail, fall panicum, barnyard grass, witchgrass. Control of yellow foxtail is only achieved with either the addition of MERGE or the addition of 28% UAN at a rate of 5 L/ha along with the recommended non-ionic surfactant.

**Uptake and Translocation:** Following foliar absorption, nicosulfuron is rapidly absorbed through the leaves and translocated in both xylem and phloem.

**Basis of Selectivity:** Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and regrowth. Tolerant species rapidly convert nicosulfuron to non-phytotoxic metabolites.

**Application Method:** Postemergent within the 1–8 leaf stage of corn.

**Residual Activity:** No soil residual activity.

**Unique Characteristics:** Emerged grasses will be controlled by nicosulfuron but subsequent germinating grasses will not be controlled. A non-ionic surfactant must be added at 0.2% v/v. Typical symptoms of plant death (chlorosis, necrosis) occur 5–10 days after application, depending on growing conditions. Do not apply to corn that has been treated with an organophosphorus soil insecticide.

### NICOSULFURON + DIFLUFENZOPYR/DICAMBA

**Trade Name:** ACCENT TOTAL (co-pack of ACCENT + DISTINCT).

**Chemical Family:** Sulfonylurea + Semicarbazone/Benzoic acid.

**Crop and/or Non-Crop Registrations:** Corn.

**Application Methods:** Postemergent, from the 2–8 leaf stage of corn.

**For All Other Information:** Refer to nicosulfuron and dicamba/diflufenzopyr alone.

### NICOSULFURON + PROSULFURON/DICAMBA

**Trade Name:** ACCENT 1-PASS (co-pack of ACCENT + PEAKPLUS).

**Chemical Family:** Sulfonylurea + Sulfonylurea/Benzoic acid.

**Crop and/or Non-Crop Registrations:** Corn.

**Application Methods:** Postemergent, up to the 7 leaf stage of corn.

**For All Other Information:** Refer to nicosulfuron and prosulfuron/dicamba alone.

NOTES ON HERBICIDES: NICOSULFURON + DIFLUFENZOPYR/DICAMBA

### NICOSULFURON/RIMSULFURON

**Trade Name:** ULTIM.

**Chemical Family:** Sulfonylurea/Sulfonylurea.

**Crop and/or Non-Crop Registrations:** Field corn. Not for use on sweet or seed corn.

**Sensitive Weeds:** Quackgrass, proso millet, green and yellow foxtail, fall panicum, barnyard grass, witchgrass, redroot pigweed (incl. triazine-resistant).

**Uptake and Translocation:** Following foliar application, nicosulfuron/rimsulfuron rapidly absorbed through the leaves and translocated in both xylem and phloem.

**Basis of Selectivity:** Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert nicosulfuron/rimsulfuron to non-phytotoxic metabolites.

**Application Method:** Postemergence, within the 1–6 leaf stage of corn.

**Residual Activity:** Rapid soil microbial degradation of nicosulfuron. Refer to notes on rimsulfuron for information on its soil residual activity.

**Unique Characteristics:** Emerged grasses will be controlled by nicosulfuron/rimsulfuron, but subsequent germinating grass weeds will not be controlled. A non-ionic surfactant must be added at 0.2% v/v. Typical symptoms of plant death (chlorosis, necrosis) occur 5–10 days after application, depending on growing conditions. Do not use on corn hybrids with a crop heat unit (CHU) rating of 2,500 or less, or in geographic regions with 2,500 or less average seasonal CHU.

### NICOSULFURON/RIMSULFURON + DIFLUFENZOPYR/DICAMBA

**Trade Name:** ULTIM TOTAL (co-pack of ULTIM + DISTINCT).

**Chemical Family:** Sulfonylurea + Semicarbazone/Benzoic acid.

**Crop and/or Non-Crop Registrations:** Corn.

**Application Methods:** Postemergence, up to the 6 leaf stage of corn.

**For All Other Information:** Refer to nicosulfuron/rimsulfuron and dicamba/diflufenzopyr alone.

### NICOSULFURON/RIMSULFURON + GLYPHOSATE

**Trade Name:** GALAXY 2 (co-pack of ULTIM + POLARIS).

**Chemical Family:** Sulfonylurea + Amino acid.

**Crop and/or Non-Crop Registrations:** Glyphosate Tolerant (“Roundup Ready”) Corn only.

**Application Methods:** Postemergence, up to the 6 leaf stage of corn.

**For All Other Information:** Refer to notes on nicosulfuron/rimsulfuron and glyphosate for additional information on each component.

### OXADIAZON

**Trade Name:** RONSTAR 2G.

**Chemical Family:** Oxadiazole.

**Crop and/or Non-Crop Registrations:** Woody ornamental shrubs, vines and trees grown in containers.

**Sensitive Weeds:** Annual weeds including stinkweed, bittercress, common groundsel, lamb's-quarters, purslane, eastern black nightshade, pigweeds, redroot, tumble, shepherd's-purse, annual bluegrass, barn-yard grass, green and yellow foxtails and crabgrass.

**Uptake and Translocation:** Primarily taken up through emerging shoots when they penetrate through the treated soil layer.

**Basis of Selectivity:** Greater physiological tolerance relative to susceptible species and lack of contact with sensitive crop tissue.

**Application Method:** Applications may be made to both newly transplanted and established ornamentals preemergent to weed germination.

Existing weed growth must be removed for satisfactory weed control.

**Residual Activity:** 60–120 days.

**Unique Characteristics:** When applied to soil, the material is rapidly and strongly fixed by soil colloids. Due to its low water solubility and to this adsorption, the downward and lateral movement is limited under the influence of rain or irrigation. Therefore, the chemical must be applied uniformly for satisfactory weed control. Moisture is required to activate the chemical. Rainfall or overhead irrigation after application will improve weed control.

## OXYFLUORFEN

**Trade Name:** GOAL 2XL.

**Chemical Family:** Diphenyl ether.

**Crop and/or Non-Crop Registrations:** Broccoli, cabbage, cauliflower, conifers, onions, raspberries, and strawberries.

**Sensitive Weeds:** Purslane, pigweed, annual nightshades, wild buckwheat, lamb's-quarters, field violet, wood-sorrels.

**Uptake and Translocation:** Primarily foliar absorption but some root absorption. Very little movement within the plant following foliar or root absorption.

**Application Methods:** Postemergence. Best control is obtained when weeds are in the 2–4 leaf stage and actively growing. The first application can be made when onions have 2 fully developed true leaves. Repeat applications may be necessary to control late-germinating weeds. Apply as a single pre-mulching spray to dormant strawberry plants. Use at least 500 L of water/ha.

**Residual Activity:** Limited preemergence activity.

**Unique Characteristics:** Use on dry bulb onions. Do not use when crop or weeds are under stress. Do not apply within 56 days prior to harvest for onions, or within 150 days prior to harvest for strawberries.

## PARAQUAT

**Trade Name:** GRAMOXONE.

**Chemical Family:** Bipyridylium.

**Crop and/or Non-Crop Registrations:** Apples, apricots, cherries, currants, gooseberries, grapes, highbush blueberries, peaches, pears and plums established more than 1 year; blackberries, loganberries and red raspberries; inter-row spraying in strawberries; established shelterbelts, filberts and hazelnuts, stale seedbed technique for vegetables and field crops; inter-row directed chemical weeding for vegetable fields and established nursery crops; asparagus; potatoes; established alfalfa and bird's-foot trefoil; pasture renovation; zero tillage corn and soybean; conifer control.

**Sensitive Weeds:** Non-selective – affects all green plants.

**Uptake and Translocation:** Absorbed by foliage and green bark; little or no translocation.

**Basis of Selectivity:** All green plant tissue is sensitive. Less effective on plants with a very waxy cuticle and linear leaf shape such as nutsedge. Safe on mature (non-green) bark of woody plants.

**Application Methods:** Postemergence. Broadcast, or directed spray to avoid contacting leaves or bark of desirable plants. Apply when weeds are less than 15 cm high. Better results are usually obtained if application is made on a dull or cloudy day, or in the evening.

**Residual Activity:** Essentially no residual activity in soil. Will persist in organic material such as mulches or turf thatch; therefore, do not reseed these areas for 5 days. More than 1 application per season may be necessary, especially for perennial weeds.

**Unique Characteristics:** Inactivated by adsorption to soil particles.

## PENDIMETHALIN

**Trade Name:** PROWL 400, PROWL H2O.

**Chemical Family:** Dinitroaniline.

**Crop and/or Non-crop Registrations:** Onions, field corn and soybean.

**Sensitive Weeds:** Green foxtail, crabgrass, barnyard grass, fall panicum, lamb's-quarters and pigweed (suppression).

**Uptake and Translocation:** Weeds are controlled as they germinate. Translocation is not significant and emerged weeds are not controlled.

**Basis of Selectivity:** No significant uptake or translocation by the crop.

**Application Methods:** Onions: postemergence to the crop at loop and 2 leaf stage. Field corn: preemergence and early postemergence. For preemergence application, pendimethalin may be applied in water or liquid fertilizer. Conduct a fertilizer compatibility test using pendimethalin and any of its registered tank-mix partners. Early postemergence application may only use water as a carrier.

**Residual Activity:** Persistence depends on weather conditions (more persistent under dry conditions). Only registered crops may be planted in the year of application. Soybeans and corn may be planted the year following application in corn. Days to harvest restriction: 100 days.

**Unique Characteristics:** Strongly adsorbed to soil particles. Most effective when rain is received within 7 days of application. For onions, apply at both growth stages for season-long control. Tank-mixes in corn or sequential application of other herbicides in onions and corn are required for broad-spectrum weed control. Registered for dry bulb onions grown on muck and mineral soils. Do not graze treated fields or feed treated foliage to livestock prior to 100 days after PROWL application.

## PICLORAM/2,4-D

**Trade Name:** TORDON 101.

**Chemical Family:** Pyridine/phenoxyl.

**Crop and/or Non-Crop Registrations:** Weed and brush (including conifer) control in non-crop locations, industrial sites and rights-of-way.

**Sensitive Weeds:** Most broadleaf herbaceous weeds including Canada thistle, sweet and red clover, wild carrot, common ragweed, dandelion, goldenrod, dock, plantain, prickly lettuce, burdock, fleabane and vetch; deciduous and coniferous woody plants except white ash.

**Uptake and Translocation:** Rapidly absorbed by the roots, stems and foliage. Translocation can be up or down but, like 2,4-D, accumulation is in young, rapidly growing meristematic tissue.

**Basis of Selectivity:** Effects on nucleic acid metabolism and growth are not observed in grasses and other tolerant species.

**Application Methods:** For deciduous and coniferous brush, apply either broadcast using a fixed nozzle (constant volume per hectare) or selectively using a spray gun (variable volume per hectare). As spray gun applications use a more dilute spray mix, this type of application must thoroughly wet the foliage, stem and root collar. Brush should be treated after foliage is well developed in spring or early summer. To ensure thorough coverage and minimize drift, brush to be treated should be less than 2.5 m tall. For cut-surface treatment, mix with water or ethylene glycol (to reduce the freezing point, if necessary) and apply to cover the cambium layer of freshly cut stumps. For broadleaf herbaceous weeds, apply broadcast in spring or early summer after growth begins.

**Residual Activity:** Soil residue carryover into the year following application is minimal when applied at recommended rates. Degradation is most rapid under warm, humid conditions. Because small residues of picloram in soil can be phytotoxic

to crops such as soybeans, tobacco, tomatoes, potatoes, grapes and many desirable ornamental plants, picloram may not be applied to land used, or land that may be used, for the production of agricultural and horticultural crops.

**Unique Characteristics:** A permit from the Ministry of the Environment is required to purchase and use picloram/2,4-D in Ontario. Picloram/2,4-D must not be applied over, or near, areas where roots of desirable trees or other plants may extend. Because spray drift is phytotoxic to sensitive plants, an approved drift-control system or additive is recommended when making low-volume applications adjacent to desirable trees or crops.

## PROMETRYNE

**Trade Name:** GESAGARD.

**Chemical Family:** S-triazine.

**Crop and/or Non-Crop Registrations:** Carrots, peas, leeks, and transplanted celery.

**Sensitive Weeds:** Lamb's-quarters, lady's-thumb, corn spurry, pigweed, wild mustard, purslane, eastern black nightshade, chickweed, hemp-nettle and green foxtail.

**Uptake and Translocation:** Absorbed through foliage and roots. Translocated upwards through xylem, accumulating in the apical meristems.

**Basis of Selectivity:** Metabolized by tolerant plants and to a lesser extent by sensitive plants, although this is not thought to be the major selective mechanism.

**Application Methods:** Preemergence or early postemergence (before weeds are 5 cm high). Apply before carrots or peas emerge. Apply 7–14 days after celery is transplanted.

**Residual Activity:** About 6–8 weeks. A fall cover crop of rye or oats may be sown on the treated land in the same season.

## PROPYZAMIDE

**Trade Name:** KERB.

**Chemical Family:** Amide.

**Crop and/or Non-Crop Registrations:** Alfalfa, bird's-foot trefoil, woody nursery stock, lettuce, apples, pears, lowbush blueberries.

**Sensitive Weeds:** Perennial grasses including quackgrass, annual grasses, volunteer cereals and common chickweed.

**Uptake and Translocation:** Taken up by plant roots and translocated to the foliage. Little foliar absorption.

**Basis of Selectivity:** Faster degradation in tolerant species.

**Application Methods:** Preemergence to annual weeds. Postemergence control of perennial grasses when applied in the fall. Apply in the fall from late September to early November when the soil temperature is low but above freezing, and soil moisture is high.

**Residual Activity:** Persistence is variable (2–9 months), depending on soil type and climatic conditions. Decomposition of the herbicide is slow at temperatures below 15°C but accelerates at temperatures above this level. Persistence is greatest in sandy soils with low organic matter.

**Unique Characteristics:** Rainfall or irrigation is required after application to move the herbicide into the root zone for uptake by perennial grasses and germinating annual grasses.

## PROSULFURON

**Trade Name:** PEAK 75WG.

**Chemical Family:** Sulfonyl urea.

**Crop and/or Non-Crop Registrations:** Corn (field and seed), sorghum, millet and wheat (winter).

**Sensitive Weeds:** Lamb's-quarters (including triazine tolerant), redroot pigweed, cocklebur, lady's thumb, wild buckwheat, wild mustard, velvetleaf, common ragweed.

**Uptake and Translocation:** Following foliar application and uptake, prosulfuron is translocated through

phloem to meristematic tissues. Growth of susceptible species ceases rapidly, followed by discolouration of leaves; death takes 1–3 weeks to occur.

**Basis of Selectivity:** Inhibition of the enzyme acetolactate synthase. Tolerant species rapidly metabolize prosulfuron.

**Application Methods:** Postemergent, corn (2–7 leaf stage), sorghum and millet (3–5 leaf stage) and winter wheat (up to stem elongation).

**Residual Activity:** Degradation primarily by soil microbial action. Prosulfuron will provide a sufficient degree of control of later germinating broadleaf weeds. Approved rotational crops are soybeans, dry beans, peas, cereals, and corn. See the label and Tables 4–4 and 4–5. *Herbicide Crop Rotation and Soil pH Restrictions*, page 70 and page 72, for information on rotational crop restrictions.

**Unique Characteristics:** Prosulfuron must be applied in a tank-mix combination with a reduced rate of dicamba in corn (field and sweet), millet and sorghum. Prosulfuron must be tank-mixed with bromoxynil in winter wheat. Refer to the each crop section for more information on applicable rates and adjuvants.

## PROSULFURON/DICAMBA

**Trade Name:** PEAKPLUS (co-pack of PEAK + BANVEL II).

**Chemical Family:** Sulfonyl urea+benzoic acid.

**Crop and/or Non-Crop Registrations:** Field corn, sorghum and millet.

**Sensitive Weeds:** Lamb's-quarters (including triazine tolerant), redroot pigweed, cocklebur, lady's thumb, wild buckwheat, wild mustard, velvetleaf, common ragweed.

**Application Methods:** Postemergent, corn (2–7 leaf stage), sorghum and millet (3–5 leaf stage) and winter wheat (up to stem elongation).

**For All Other Information:** Refer to prosulfuron and dicamba alone.

## PYRASULFOTOLE/BROMOXYNIL

**Trade Name:** INFINITY.

**Chemical Family:** Benzoylpyrazole and hydroxybenzonitrile.

**Crop and/or Non-Crop Registrations:** Wheat (spring, durum winter), barley, triticale and timothy (seed production only).

**Sensitive Weeds:** Annual broadleaf weeds including ALS (Group 2) resistant biotypes: annual sow-thistle, chickweed, cleavers, common ragweed, flixweed, hemp-nettle, kochia, lamb's-quarters, pale smartweed, redroot pigweed, suppression of round-leaf mallow giant ragweed and spreading atriplex, Russian thistle, shepherd's purse, stinkweed, volunteer canola (conventional and herbicide tolerant), wild buckwheat and wild mustard. Suppression of perennial weeds including: Canada thistle, dandelion, perennial sow-thistle.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Postemergence – Apply to emerged, young, actively growing weeds. Under cool and/or dry conditions activity may be reduced or delayed. Weed control may also be reduced if application is made when weeds are dust covered or in the presence of heavy dew, fog, or mist/rain. Apply in a minimum of 46.8 L of water/ha at a pressure of 275 kPa. Crops may be treated from the 1 leaf stage of growth until the flag leaf is just visible but still rolled.

**Residual Activity:** Essentially none.

**Unique Characteristics:** Application beyond emergence of the flag leaf may result in crop injury. Do not apply to a crop that is stressed by severe weather conditions, frost, low fertility, drought, water-saturated soil, disease or insect damage, as crop injury may result. Do not apply to crops under-seeded with legume species. Do not store below -20°C.

## PYRAZON

**Trade Name:** PYRAMIN FL.

**Chemical Family:** Pyridazinone.

**Crop and/or Non-Crop Registrations:** Sugar beets and table beets. Apply with NORTRON on sugar beets.

**Sensitive Weeds:** Annual nightshades, chickweed, knotweed, lady's-thumb, lamb's-quarters, oak-leaved goosefoot, prostrate pigweed, purslane, ragweed, redroot pigweed, shepherd's-purse, smartweed, stinkweed, wild buckwheat, wild carrot (seedling), wild mustard, wormseed mustard and yellow rocket (seedling).

**Uptake and Translocation:** Can be taken up by both roots and leaves, but translocation is upward to leaves where it inhibits photosynthesis.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Preplant incorporated, preemergence, or postemergence after the second true-leaf stage of the beets.

**Residual Activity:** Average persistence is about 4–8 weeks in soil, depending on soil moisture and temperature. Residue carryover problems are unlikely.

**Unique Characteristics:** With preemergence applications, at least 1.25 cm of rainfall is required for good weed control. Combinations of pyrazon and TCA are most useful where both annual broadleaf weeds and grasses are a problem. These treatments may not be effective on high organic soils or dry soils (i.e., muck soils or with late planted beets when soils are drier). Under these circumstances, postemergence applications of pyrazon plus TCA as a band over the row may be most effective. However, to be selective and effective the chemicals must be applied after the cotyledons of the beets are 2.5 cm long and before the weeds have reached the 4 true-leaf stage (10 cm). Where TCA has been used, do not feed beet tops to livestock. TCA residues in the soil can be a problem for some crops such as corn.

## QUIZALOFO-P-ETHYL

**Trade Name:** ASSURE II.

**Chemical Family:** Aryloxyphenoxypropionate.

**Crop and/or Non-Crop Registrations:** Canola, flax, a number of different edible bean market classes, refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97 for specific crop registrations, peas, rutabagus, industrial fibre hemp, seed alfalfa, soybeans and sugar beets.

**Sensitive Weeds:** Green foxtail, barnyard grass, fall panicum, witchgrass, proso millet, wild oats, volunteer cereals and volunteer corn.

**Uptake And Translocation:** Rapidly absorbed and readily translocated in both the xylem and phloem from the treated foliage to the root system and growing points of the plant.

**Basis of Selectivity:** Disruption of fatty acid biosynthesis leading to increased permeability and cellular disruption in sensitive plants. Rapid metabolism of the active herbicide in tolerant species.

**Application Methods:** Postemergence.

**Residual Activity:** Rapid microbial degradation and essentially no soil activity.

**Unique Characteristics:** Apply with SURE-MIX at 5 L/1,000 L of spray solution.

## RIMSULFURON

**Trade Name:** ELIM EP (available only in BATTALION), PRISM, PRISM SG.

**Chemical Family:** Sulfonylurea.

**Crop and/or Non-Crop Registrations:** ELIM EP – Field corn. Not for use on sweet or seed corn. PRISM – Potatoes, transplanted processing tomatoes. Not for use on potatoes grown for seed.

**Sensitive Weeds:** Green foxtail, fall panicum, barnyard grass, redroot pigweed (incl. triazine-resistant), hairy nightshade, yellow foxtail (suppression), witchgrass, lamb's-quarters.

**Uptake and Translocation:** Following foliar application, rimsulfuron is rapidly absorbed through the leaves and translocated in both xylem and phloem.

**Basis of Selectivity:** Inhibition of acetolactate synthase (ALS) enzyme in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert rimsulfuron to non-phytotoxic metabolites.

**Application Method:** Postemergent, within the spike to 3 leaf stage of corn. Prior to initiation of flowering in potatoes.

**Residual Activity:** Provides season long control of labeled weeds to canopy closure.

**Unique Characteristics:** See nicosulfuron/rimsulfuron.

## RIMSULFURON + S-METOLACHLOR + DICAMBA

**Trade Name:** BATTALION (co-pack of ELIM EP + DUAL II MAGNUM + BANVEL II).

**Chemical Family:** Sulfonylurea + Acetanilide + Benzoic acid.

**Crop and/or Non-Crop Registrations:** Corn.

**Application Methods:** Preemergence and postemergence up to the 3 leaf stage of corn.

**For All Other Information:** Refer to rimsulfuron, s-metolachlor and dicamba alone.

## SAFLUFENACIL

**Trade Names:** ERAGON.

**Chemical Family:** Diphenyl ether.

**Crop and/or Non-Crop Registrations:** Barley, corn (field and sweet), soybean and wheat. Dessicant in edible beans and soybean.

**Sensitive Weeds:** Canada fleabane, common ragweed, lamb's-quarters, redroot pigweed, stinkweed, velvetleaf, wild buckwheat, wild mustard and dandelion (suppression).

**Uptake and Translocation:** Emerged plants will take product up primarily by the foliage but sensitive non-emerged species will take up product through

the roots and shoots. ERAGON is translocated mainly in the xylem and has limited mobility in the phloem.

**Basis of Selectivity:** Metabolized by tolerant species.

**Application Methods:** Preplant (soybean), preplant and preemergence (barley, wheat, corn and sweet corn), preharvest dessicant in edible beans and soybean.

**Residual Activity:** Dependent on rate, the 36–71 g/ha rate provides limited residual activity while the 107–143 g/ha rate provides much longer residual activity.

**Unique Characteristics:** Sensitive weed species will begin to show injury symptoms within hours and will typically die within 3 days, depending on environmental conditions. Any crop can be safely grown the year following applications of ERAGON at the 36 g/ha rate. A number of crops can be grown the year following applications of ERAGON at the high rate, refer to Tables 4-4 and 4-5, *Herbicide Crop Rotation and Soil pH Restrictions*, on page 70 and page 72, and the product label for more specific direction.

## SAFLUFENACIL/DIMETHENAMID-P

**Trade Names:** INTEGRITY.

**Chemical Family:** Diphenyl ether and chloroacetamide.

**Crop and/or Non-Crop Registrations:** Corn (field and sweet).

**Sensitive Weeds:** Barnyard grass, crabgrass (smooth, large), eastern black nightshade, fall panicum, foxtails (green, yellow and giant), witchgrass, common ragweed, lamb's-quarters, redroot pigweed, velvetleaf, wild buckwheat, wild mustard and yellow nutsedge (PPI only). Refer to saflufenacil for other sensitive species.

**Uptake and Translocation:** Absorbed through shoots and roots of germinating grass and broadleaf weeds.

**Basis of Selectivity:** Unknown for dimethenamid-P, saflufenacil is metabolized by tolerant species.

**Application Methods:** Preplant incorporated and preemergence.

**Residual Activity:** Provides season-long weed control. Length of residual activity depends upon soil and moisture factors, application rate and timing. Heavy rainfall following an incorporated treatment may reduce weed control.

**Unique Characteristics:** A number of crops can be grown the year following applications of INTEGRITY, refer to Tables 4-4 and 4-5, *Herbicide Crop Rotation and Soil pH Restrictions*, on page 70 and page 72, and the product label for more specific direction.

## S-METOLACHLOR

**Trade Names:** DUAL MAGNUM, DUAL II MAGNUM.

**Chemical Family:** Acetanilide.

**Crop and/or Non-Crop Registrations:** Corn, soybeans, a number of different edible bean market classes, refer to Table 7-1. *Beans (Adzuki, Dry, Lima and Snap) Weed Control Ratings*, page 97 for specific crop registrations, transplanted cole crops (cabbage, cauliflower, broccoli), transplanted tomatoes, potatoes, sugar beets, processing peas, rutabagas and sweet white lupins, apples, apricots, cherries, peaches, pears and plums, highbush blueberries, transplanted cantaloupe, carrots, cucumbers, mustard greens, ornamentals, peppers, squash, strawberries and sweet potatoes.

**Sensitive Weeds:** Large and smooth crabgrass; witchgrass; barnyard grass; fall panicum; giant, green and yellow foxtail; yellow nutsedge; American nightshade, eastern black nightshade and tall waterhemp.

**Uptake and Translocation:** Absorbed by germinating grasses mainly through the shoot just above seed. Absorbed by germinating broadleaf weeds through roots and shoots.

**Basis of Selectivity:** Metabolized by tolerant species.

**Application Methods:** Early preplant, preplant incorporated and preemergence. Early postemergence on corn (spike to 2 leaf stage of corn). Incorporation equipment should be set to work the soil 10 cm deep with a disc operating at 6–10 km/hr or a vibrating shank cultivator at 10–13 km/hr; 1 incorporation is sufficient and need not be immediate. Rainfall within 10 days is required for maximum activity of the preemergence application.

**Residual Activity:** Activity will normally be maintained for 10–14 weeks.

**Unique Characteristics:** The rate required depends on weed pressure (higher rate for heavier weed pressure). Yellow nutsedge control requires a preplant incorporated application. Winter cereals may be planted 4–5 months after metolachlor application. Many tank-mix combinations are registered on various crops. Do not use on muck soils or coarse-textured soils low in organic matter. DUAL II MAGNUM contains benoxacor, a chemical that enhances the corn plant's ability to metabolize s-metolachlor, thereby preventing corn injury even under adverse environmental conditions.

## S-METOLACHLOR/ATRAZINE

**Trade Name:** PRIMEXTRA II MAGNUM.

**Chemical Family:** Acetanilide/s-triazine.

**Crop and/or Non-Crop Registrations:** Corn (ensilage, field, seed and sweet).

**Sensitive Weeds:** Germinating annual broadleaf weeds and annual grasses such as American nightshade, eastern black nightshade, lady's-thumb, lamb's-quarters, wild mustard, purslane, prostrate pigweed, redroot pigweed, wild buckwheat, smartweed, ragweed, crabgrass, barnyard grass, green foxtail, yellow foxtail, giant foxtail, witchgrass and fall panicum. Yellow nutsedge can be controlled with a preplant incorporated application.

**Uptake and Translocation:** Absorbed by germinating grasses mainly through shoot just above seed. Absorbed by germinating broadleaf weeds through roots and shoot.

**Basis of Selectivity:** Metabolized by tolerant species.

**Application Methods:** Early preplant, preplant incorporated, and preemergence. Early postemergence on corn (spike to 2 leaf stage of corn). Incorporation equipment should be set to work the soil 10 cm deep with a disc operating at 6–10 km/hr or a vibrating shank cultivator at 10–13 km/hr. One incorporation is sufficient and need not be immediate. Rainfall within 10 days is required for maximum activity of the preemergence application. S-metolachlor/ atrazine may be applied in nitrogen solutions or liquid fertilizers for preplant incorporated or preemergence weed control. Dry bulk granular fertilizers may be impregnated with metolachlor/ atrazine for preplant incorporation.

**Residual Activity:** Activity will normally be maintained for 10–14 weeks; late-germinating fall panicum will not be controlled. Soybeans, white beans, oats or barley may be planted the following spring.

**Unique Characteristics:** The rate required depends on weed pressure (higher rate for heavier weed pressure). Yellow nutsedge control requires a preplant incorporated application. Will not control triazine-resistant weed species. Contains atrazine in low amounts, which may carry over in a dry year. Is effective over a wide range of soil types and has a good margin of crop safety. Perennial weeds are not controlled. Primextra II MAGNUM contains benoxacor, a chemical that enhances the corn plant's ability to metabolize s-metolachlor, thereby preventing corn injury even under adverse environmental conditions.

## SCLEROTINIA MINOR (STRAIN IMI 344141)

**Trade Names:** SARRITOR GRANULAR BIOLOGICAL HERBICIDE.

**Crop and/or Non-Crop Registrations:** Turfgrass.

**Sensitive Weeds:** Dandelion.

**Uptake and Translocation:** The active ingredient, Sclerotinia minor is a naturally occurring fungus that when applied to dandelion will grow into the weed and absorb plant tissue until the weed is controlled.

**Application Methods:** Postemergence. Apply when daytime high temperatures are 18–24°C and when rainfall occurs within 12 hours of application.

**Residual Activity:** Essentially none, will not control unemerged dandelion.

**Unique Characteristics:** SARRITOR will usually take between 5–7 days to suppress/control dandelion. This product will not affect grass species, but severe damage to non-target desirable broadleaf plant species may occur if SARRITOR comes in contact.

## SETHOXYDIM

**Trade Name:** POAST ULTRA.

**Chemical Family:** Cyclohexanedione.

**Crop and/or Non-Crop Registrations:** Canola, flax, soybeans, a number of different edible bean market classes, refer to Table 7-1. Beans (*Adzuki, Dry, Lima and Snap*) Weed Control Ratings, page 97 for specific crop registrations peas, onions, tomatoes, potatoes, sweet potato, pumpkin, squash, cucumbers, alfalfa, buckwheat, creeping red fescue, garlic, broccoli, cabbage, cauliflower, chicory, peppermint, spearmint, snow peas, apples, apricots, cherries, peaches, pears, plums, highbush blueberries, cranberries, strawberries and sethoxydim-resistant corn.

**Sensitive Weeds:** Wild oats, foxtails, barnyard grass, large crabgrass, proso millet, fall panicum, witchgrass, volunteer corn and cereals and quackgrass.

**Uptake and Translocation:** Absorbed by foliage.

Translocated upwards and downwards in plant.

**Basis of Selectivity:** Degraded by tolerant species (broadleaf plants).

**Application Methods:** Postemergence to actively growing annual grasses in the 1–6 leaf stage and quackgrass in the 1–3 leaf stage. Use flat fan nozzles and add MERGE adjuvant to the spray mix. Alternatively, ASSIST OIL CONCENTRATE or Ammonium sulphate plus ASSIST OIL CONCENTRATE may be used. Other postemergence herbicides not recommended as tank-mix combinations on the label must be applied at least 4 days before or after sethoxydim application. Aerial application is also registered.

**Residual Activity:** Essentially none. A second application and/or cultivation may be necessary to control grasses that emerge after treatment.

**Unique Characteristics:** Susceptible grasses, when sprayed, stop growing immediately and then gradually turn yellow to purple to brown over a period of 7–21 days, depending on growing conditions and crop competition. Rainfall within 1 hour after application may reduce effectiveness. If treated grasses are stressed (drought, flooding, prolonged cool temperatures) control will be delayed or reduced.

## SIMAZINE

**Trade Names:** PRINCEP NINE-T, SIMADEX, SIMAZINE 480.

**Chemical Family:** S-triazine.

**Crop and/or Non-Crop Registrations:** Corn, established asparagus, bird's-foot trefoil, raspberries, loganberries, blackberries, highbush blueberries, alfalfa, apples, apricots, cherries, peaches, pears and plums established for 1 year or more; grapes established for 3 or more years; shelterbelts established for at least one growing season (*caragana*, green ash, Siberian elm, American elm and Manitoba maple); new or established

Christmas tree and woodland plantations (2 years or older white pine and balsam fir); woody ornamentals and nursery stock established for at least 1 year (cedar, barberry, apple, flowering crab apple, box wood, cotoneaster, dogwood, holly, rose, yews, chamaecyparis, hemlock, juniper, multiflora rose, peony; spruce, mugho pine, black walnut and white ash); nursery container stock (cedar, juniper, yew); aquatic weed control; non-cropland. Conifer site preparation before planting of fir, pine and spruce (PRINCEP NINE-T only).

**Sensitive Weeds:** Annual broadleaf weeds such as pigweed, lady's-thumb, lamb's-quarters, purslane, ragweed, volunteer clover, wild buckwheat, smartweed, plantain and groundsel; annual grasses such as barnyard grass, crabgrass, wild oats and yellow foxtail (triazine-resistant biotypes of foxtail, lamb's-quarters, pigweed and groundsel will not be controlled); most perennial species starting freshly from seed.

**Uptake and Translocation:** Absorbed by roots; little or no foliar absorption; translocated upwards in xylem, accumulating in apical meristem and leaves with napropamide on new plantings of apples, apricot, cherries, plums, peaches and pears.

**Basis of Selectivity:** Some species, such as corn, metabolize simazine. In most crops, selectivity is based on the roots of the crop plants being deeper than the depth to which simazine leaches.

**Application Methods:** Preplant incorporated (to a depth of 2.5 cm) or preemergence in corn; preemergence in other crops. Broadcast or band application. In fruit crops, apply a 1 m wide band under the plants; cultivate or sod the area between the rows. For aquatic weed control, apply as a draw-down treatment or water-volume application in drainage ditches and ponds with no water flow-through.

**Residual Activity:** Soil residues may persist for more than 1 season. After spraying with simazine, do not plant any crop in the treated area in the same

year except corn. Where rates in excess of 2 kg/ha have been applied, do not plant rotational crops in the following year; soils should be tested if there is any question of excessive residues remaining.

**Unique Characteristics:** Needs sufficient moisture to be activated. Should be applied only once per season. To avoid build-up of resistant weeds, simazine should be rotated with other non-triazine residual herbicides. Simazine is more persistent than atrazine. Where rainfall is sufficient to cause erosion, soil containing simazine may wash to lower areas of land and injure existing or subsequent crops.

## SURFACTANT

See Chapter 5, *Notes on Adjuvants*, page 77.

## TEMBOTRIONE/THIENCARBAZONE-METHYL

**Trade Name:** VIOS G3

**Chemical Family:** Triketone/sulfonylaminocarbonyltriazolinones.

**Crop and/or Non-Crop Registrations:** Glyphosate tolerant ("Roundup Ready") or Glufosinate-ammonium tolerant ("Liberty Link") corn only.

**Sensitive Weeds:** Emerged annual grass and broadleaf weeds controlled by glyphosate or Liberty herbicide and residual control of weeds specified in Table 9-5, *Glyphosate Tolerant ("Roundup Ready") Corn Herbicide Weed Control Ratings*, page 149.

**Uptake and Translocation:** Tembotrione – foliar uptake, Thiencarbazone-methyl – foliar and soil uptake.

**Basis of Selectivity:** Metabolism by tolerant species.

**Application Methods:** Postemergence from the 1–6 leaf stage of "Roundup Ready" or "Liberty Link" field corn.

**Residual Activity:** VIOS G3 will provide residual control of lamb's-quarters, redroot pigweed, wild buckwheat, lady's thumb, wild mustard, common hempnettle, common chickweed, spiny annual

sowthistle, common ragweed, velvetleaf, eastern black nightshade, green foxtail, yellow foxtail, barnyard grass, witchgrass and large crabgrass.

**Unique Characteristics:** VIOS G3 has a very low use rate and convenient packaging. It must always be tank-mixed with either glyphosate or LIBERTY 200SN.

## TERBACIL

**Trade Name:** SINBAR, SINBAR WDG.

**Chemical Family:** Uracil.

**Crop and/or Non-Crop Registrations:** Apples, apricots, cherries, highbush blueberries, peaches, pears, plums, spearmint, peppermint, raspberries and strawberries; with napropamide on new plantings of apples, apricots, cherries, plums, peaches and pears.

**Sensitive Weeds:** Barnyard grass, bluegrass, crabgrass, foxtail, chickweed, cheat grass, perennial rye grass, wild barley, mustard, prickly lettuce, stinkweed, annual sow-thistle, henbit, lamb's-quarters, pigweed, purslane and ragweed. Partial control of quackgrass, horsenettle, vetch and yellow nutsedge.

**Uptake and Translocation:** Uptake is mostly through roots, although partially through foliage and stem. Translocation is upward into leaves.

**Basis of Selectivity:** Used only on established plantings so that roots of crop are below depth to which chemical penetrates. May also be slower translocation and faster degradation in tolerant species.

**Application Methods:** Apply to the soil surface in 200–1,000 L water/ha. If weed growth is present in apples, paraquat may be mixed with spray. Rates for strawberries are considerably lower and can be applied in spring, postharvest or late fall. Control of perennial grasses may be improved by cultivation prior to treatment.

**Residual Activity:** May be up to 2 years. Residues are likely to be higher on heavier soil types if higher rates and repeated applications are used.

**Unique Characteristics:** Moisture is necessary to activate the chemical within 2 weeks after application. Do not apply on soils with less than 1% organic matter, nor on eroded soil areas. Use lower rates on soils with 1–2% organic matter. Do not apply on weak or diseased strawberry plants.

## THIFENSULFURON-METHYL

**Trade Name:** PINNACLE SG.

**Chemical Family:** Sulfonyl urea.

**Crop and/or Non-Crop Registrations:** Soybeans, tomatoes.

**Sensitive Weeds:** Redroot pigweed, lamb's-quarters, velvetleaf, lady's-thumb and wild mustard.

**Uptake and Translocation:** Following foliar application, the herbicide is rapidly absorbed and translocated in both the xylem and phloem to growing points of sensitive weeds.

**Basis of Selectivity:** Inhibition of acetolactase synthase (ALS) enzyme in susceptible plants that leads to a rapid cessation of cell division and plant growth. Tolerant species rapidly metabolize the herbicide into non-phytotoxic metabolites.

**Application Method:** Postemergence.

**Residual Activity:** Rapid soil microbial degradation. Half-life of 5 days at 25°C soil temperatures.

**Unique Characteristics:** Labelled species can be controlled up to 10 cm in height. Redroot pigweed is very sensitive. Typical symptoms of plant death (leaf crinkling, curling, chlorosis) occur 5–10 days after application depending on the growing conditions. Velvetleaf control is greatly enhanced by the inclusion of ammonium containing fertilizer (such as a UAN solution).

## THIFENSULFURON-METHYL/ TRIBENURON-METHYL

**Trade Name:** REFINE SG, REFINE M (co-pack of REFINE SG + MCPA).

**Chemical Family:** Sulfonyl urea.

**Crop and/or Non-Crop Registrations:** Wheat (spring, winter, Durum), barley, oats not underseeded to legumes or grasses. Refine SG can be applied to winter wheat in the fall or the spring.

**Sensitive Weeds:** Lamb's-quarters, annual smartweed (green smartweed, lady's-thumb), chickweed, hemp-nettle, wild buckwheat, cow cockle, stinkweed, Canada thistle, sow-thistle, round-leaved mallow.

**Uptake and Translocation:** Following foliar application, is rapidly absorbed and translocated in both xylem and phloem.

**Basis of Selectivity:** Inhibition of acetolactate synthase in susceptible plants leads to a rapid cessation of cell division and growth. Tolerant species rapidly convert to non-phytotoxic metabolites.

**Application Method:** Postemergence.

**Residual Activity:** Rapid soil microbial degradation.

**Unique Characteristics:** A non-ionic surfactant must be added. Typical symptoms of plant death (leaf crinkling, curling, chlorosis) occur 5–10 days after application depending on growing conditions. Tank-mixes with MCPA and 2,4-D for control of ragweed and mustards.

## TOPRAMEZONE

**Trade Name:** IMPACT, ARMEZON.

**Chemical Family:** Pyrazolone.

**Crop and/or Non-Crop Registrations:** Corn (field, seed and sweet).

**Sensitive Weeds:** Annual broadleaf and grassy weeds, including triazine and group 2 resistant biotypes.

**Basis of Selectivity:** Inhibits the HPPD enzyme found in photosynthetic cells of susceptible species. Symptoms on susceptible plants are bleaching followed by necrosis. Tolerant species rapidly metabolize topramezone.

**Application Methods:** Postemergence in field corn between the 1–8 leaf stage for broadleaf weeds and 1–4 leaf stage of grassy weeds.

NOTES ON HERBICIDES: TOPRAMEZONE

**Residual Activity:** Degradation primarily by soil microbial action. Topramezone provides soil residual activity against broadleaf weeds.

**Unique Characteristics:** The activity of topramezone is significantly enhanced by atrazine. A tank mix of Topramezone with atrazine and dimethenamid-P provides a one-pass, postemergence weed control program with residual activity against grass and broadleaf weeds.

## TRALKOXYDIM

**Trade Name:** ACHIEVE LIQUID.

**Chemical Family:** Cyclohexanedione.

**Crop and/or Non-Crop Registrations:** Wheat (Durum, spring and winter), spring barley, rye (spring and winter), triticale, crested wheatgrass, creeping red fescue, meadow and smooth bromegrass, northern wheatgrass, slender wheatgrass and western wheatgrass.

**Sensitive Weeds:** Wild oats.

**Uptake and Translocation:** Uptake through the leaves, translocated to growing points of roots, shoots and leaves.

**Basis of Selectivity:** Metabolized in tolerant species.

**Application Methods:** Postemergence to actively growing wild oats at 1–5 leaf stage. Rainfast in 1 hour.

**Residual Activity:** None.

**Unique Characteristics:** Safe on all varieties of spring wheat and barley. May be applied to cereal crops underseeded to legumes such as clover, alfalfa, sainfoin or bird's-foot trefoil. Do not feed or graze forage in year of treatment.

## TRICLOPYR

**Trade Name:** GARLON 4, GARLON ULTRA, GARLON XRT, GARLON RTU, RELEASE.

**Chemical Family:** Pyridine.

**Non-Crop Registrations:** GARLON 4 – Site preparation for lowbush blueberry, nursery stock

and the control of unwanted woody plants and annual and perennial broadleaf weeds in non-crop areas including rights-of-way, electrical power lines, communication lines, pipelines, roadsides and manufacturing and storage sites. RELEASE silvicultural herbicide is recommended for the control of undesirable woody plants and annual and perennial broadleaf weeds in woodland management.

**Sensitive Weeds:** Woody plant species controlled are: alder, ash, aspen, basswood, beech, birch, blackberry, raspberry, buckthorn, cottonwood, dogwood, elderberry, hawthorn, hickory, hop-hornbeam, locust, maples, mulberry, poison-oak, poplar, sumac, willow, honey locust, choke cherry, elm, red maple, oaks and pines. Annual and broadleaf weeds controlled are: burdock, chicory, curled dock, dandelion, field bindweed, lamb's-quarters, ragweed, smartweed, smooth bedstraw, vetch and wild lettuce.

**Uptake and Translocation:** Triclopyr is absorbed by both plant leaves and roots. It is readily translocated through plants. It tends to accumulate in meristematic tissues and is not readily metabolized in susceptible plants.

**Basis of Selectivity:** Tolerant species such as grasses rapidly metabolize triclopyr.

**Application Methods:** For deciduous and certain conifer species use as a foliage spray when brush species are actively growing. Apply either broadcast using a fixed nozzle (constant volume per ha) or selectively using a spray gun (variable volume per ha). As spray gun applications use a dilute spray mix, this type of application must thoroughly wet the foliage, stem and root collar. Brush should be treated after foliage is well developed and actively growing. For conifer release in woodland sites, apply in late summer after conifers have hardened off and deciduous trees are in full leaf but prior to autumn colouration. Woody plants may also be

controlled by using basal bark, dormant stem and cut-surface treatments.

**Residual Activity:** Half-life in soil is approximately 30 days under conditions that are favourable for microbial decomposition.

**Unique Characteristics:** Apply only when there is little or no hazard from spray drift. Small quantities of spray drift may injure susceptible broadleaf plants.

## TRIFLURALIN

**Trade Names:** BONANZA 480, RIVAL, TREFLAN EC.

**Chemical Family:** Dinitroaniline.

**Crop and/or Non-Crop Registrations:** Soybeans, winter wheat, black, kidney, lima, snap and white beans, faba beans, snap beans, lima beans, black beans, canola forage kale, sunflowers, turnips, peas (field and canning), mustard, direct-seeded alfalfa; transplants of tomatoes, peppers, Brussels sprouts, broccoli, cabbage and cauliflower; carrots, crambe, direct-seeded cabbage and cauliflower, annual flowers, woody ornamental plantings and field-grown nursery stock, perennials, established shelterbelts, strawberries.

**Sensitive Weeds:** Most annual grasses, pigweed and lamb's-quarters, including the triazine-tolerant biotypes.

**Uptake and Translocation:** No significant absorption or translocation of trifluralin in crops grown in

soil treated with trifluralin. Susceptible weeds are controlled as they germinate. Established weeds are not controlled.

**Basis of Selectivity:** Physiological growth processes associated with seed germination.

**Application Methods:** Preplant incorporated. Apply in 100–300 L of water/ha. Use lower rate of the chemical on sandy soils and increased rate for loam-to-clay soils. Do not use on highly organic soils (muck, peat or black sands above 15% organic matter). Incorporate twice in cross directions using a tandem disc (7–10 km/hr) or tine cultivator (10–13 km/hr) set to work 8–10 cm deep. The first incorporation should be done as soon as possible after application, but may be delayed 8–24 hours, depending on label directions. The second incorporation is recommended anytime before planting. Activated upon incorporation; rainfall is not required.

**Residual Activity:** Recommended application rates provide season-long weed control. Succeeding crops, even fall-seeded grain crops planted in soil that received trifluralin the preceding spring, will not be injured under normal conditions.

**Unique Characteristics:** Strongly adsorbed to soil particles and shows negligible leaching. Organic matter and clay content influence application rate. Does not control ragweed, annual nightshades or mustards; lady's-thumb may escape.

## TRIFLUSULFURON-METHYL

**Trade Name:** UPBEET.

**Chemical Family:** Sulfonylurea.

**Crop and/or Non Crop Registrations:** Sugar beets, chicory and red beets. With BETAMIX on sugar beets.

**Sensitive Weeds:** Redroot and green pigweed, velvetleaf.

**Uptake And Translocation:** Following foliar application, the herbicide is rapidly absorbed and translocated in both the xylem and phloem to growing points of sensitive weeds.

**Basis of Selectivity:** Inhibition of acetolactase synthase (ALS) enzyme in susceptible plants that leads to a rapid cessation of cell division and plant growth. Tolerant species rapidly metabolize the herbicide into non-phytotoxic metabolites.

**Application Methods:** Postemergence.

**Residual Activity:** None.

**Unique Characteristics:** Must be applied with an approved adjuvant system including 0.2% v/v non-ionic surfactant. Addition of 28% urea ammonium nitrate (U.A.N.) at 2 L/ha will improve weed control. Plant death of target weeds may take from 1–3 weeks for visual symptoms to develop. Symptoms develop more quickly under favourable growing conditions.

**TABLE 4-3. Glyphosate Products, Registered Uses and Rates Needed to Control Specific Weed Species in Glyphosate Tolerant Crops**

Trade Name	Guaranteed Active Concentration	GLYPHOSATE TOLERANT CROPS <sup>1</sup>				WEED SPECIFIC GLYPHOSATE PRODUCT RATES (L/Ac) <sup>2</sup> IN GLYPHOSATE TOLERANT CORN, SOYBEAN AND SUGARBEETS

<sup>1</sup> Checkmarks indicate that the corresponding Trade Name is registered for use on glyphosate tolerant canola, corn, soybeans and sugarbeets.

<sup>2</sup> The maximum rate of glyphosate that can be used on glyphosate (540 g/L) tolerant Canola is 0.5 L/ac. Refer to the glyphosate tolerant Canola section in Chapter 12, page 217 for weeds that are sensitive at that rate.

**TABLE 4-6. Weed Populations Confirmed Resistant to Herbicide Groups in Ontario Counties<sup>1</sup>**

<b>WSSA GROUP<sup>2</sup></b> <b>From Table 4-1, page 29</b>	<b>Site of Action</b>	<b>Confirmed herbicide resistant weeds in Ontario (As of Dec, 2011)</b>	<b>Location(s)</b>
1	Inhibitors of acetyl CoA carboxylase (ACCase)	Currently none confirmed.	
2	Inhibitors of acetolactate synthase (ALS) and also called acetohydroxyacid synthase (AHAS)	Redroot and green pigweed <sup>3</sup>	Bruce; Elgin; Essex; Hamilton–Wentworth; Haldimand; Huron; Kent; Lambton; Lennox & Addington; Middlesex; Oxford; Perth; Simcoe; Stormont, Dundas & Glengarry; Wellington
		Lamb's-quarters <sup>3</sup>	Elgin; Essex; Kent; Lambton; Middlesex; Simcoe; Stormont, Dundas & Glengarry
		Green foxtail	Huron; Lambton; Oxford; Perth; Wellington; Victoria
		Giant foxtail	Essex; Elgin; Lambton; Oxford
		Cocklebur	Lambton
		Eastern black nightshade	Bruce; Carleton; Elgin; Huron; Middlesex; Oxford; Perth; Simcoe; Stormont, Dundas & Glengarry; Wellington
		Common ragweed	Bruce; Carleton; Elgin; Essex; Haldimand–Norfolk; Huron; Kent; Lambton; Middlesex; Niagara; Oxford; Perth; Prexcott–Russell; Simcoe; Stormont, Dundas & Glengarry; Wellington
		Waterhemp	Bruce; Lambton; Essex
3	Microtubule assembly inhibitors	Currently none confirmed.	
4	Synthetic auxins	Wild carrot	Halton; Wellington
5	Inhibitors of photosynthesis at photosystem II, Site A	Barnyard grass	Waterloo
		Common groundsel	York
		Common ragweed	Brant; Essex; Haldimond–Norfolk; Hamilton–Wentworth; Lambton; Lennox & Addington; Niagara; Wellington
		Goosefoot	Brant
		Lamb's-quarters <sup>4</sup>	Numerous counties throughout Ontario
		Green pigweed <sup>4</sup>	Elgin; Huron; Oxford; Wellington
		Redroot pigweed <sup>4</sup>	Kent; Stormont, Dundas & Glengarry; Waterloo
		Waterhemp	Essex; Lambton
		Wild mustard	Former Glengarry (Now Stormont, Dundas & Glengarry)
		Witchgrass	Grey; Haldimond-Norfolk; Leeds & Grenville; Prescott–Russell; Wellington
		Yellow foxtail	York

<sup>1</sup> If you suspect that you have a herbicide resistant weed contact the Department of Plant Agriculture, University of Guelph at 519-824-4120 Ext 58372 for more information on testing services.

<sup>2</sup> Herbicide groupings for Ontario follow the Weed Science Society of America's nationally accepted grouping. Groups 12, 13, 16, 17, 18, 21, 24, 25 and 26 are not available in Ontario.

<sup>3</sup> Populations exist that are also resistant to group 5 herbicides.

<sup>4</sup> Populations also exist that are resistant to group 2 herbicides.

**TABLE 4-6. Weed Populations Confirmed Resistant to Herbicide Groups in Ontario Counties<sup>1</sup> (cont'd)**

<b>WSSA GROUP<sup>2</sup></b> <b>From Table 4-1, page 29</b>	<b>Site of Action</b>	<b>Confirmed herbicide resistant weeds in Ontario (As of Dec. 2011)</b>	<b>Location(s)</b>
6	Inhibitors of photosynthesis at photosystem II, Site B	Redroot pigweed Smooth pigweed	Essex; Kent Essex
		Green pigweed	Simcoe
7	Inhibitors of photosynthesis at photosystem II, Site B (alternate binding site)	Redroot pigweed	Kent; Middlesex; Simcoe
8	Conjugation of acetyl co-enzyme A	Currently none confirmed.	
9	Inhibitors of 5-enolpyruylshikimimate-3-phosphate synthase (EPSP)	Canada fleabane	Kent
		Giant ragweed	Essex
10	Inhibitors of glutamine synthetase	Currently none confirmed.	
11	Inhibitors of carotenoid biosynthesis	Currently none confirmed.	
13	Diterpene synthesis inhibitor	Currently none confirmed.	
14	Inhibitors of protoporphyrinogen oxidase (Protox)	Currently none confirmed.	
15	Conjugation of acetyl co-enzyme A	Currently none confirmed.	
19	Inhibitors of auxin transport system	Currently none confirmed.	
20	Inhibits cell wall synthesis, Site A	Currently none confirmed.	
22	Photo system I – electron diverters	Canada fleabane	Essex
		Eastern black nightshade	Essex
		Field peppergrass	Essex
23	Inhibitors of mitosis	Currently none confirmed.	
27	Inhibitors of p-hydroxyphenyl pyruvate dioxygenase (HPPD)	Currently none confirmed.	

<sup>1</sup> If you suspect that you have a herbicide resistant weed contact the Department of Plant Agriculture, University of Guelph at 519-824-4120 Ext 58372 for more information on testing services.

<sup>2</sup> Herbicide groupings for Ontario follow the Weed Science Society of America's nationally accepted grouping. Groups 12, 13, 16, 17, 18, 21, 24, 25 and 26 are not available in Ontario.

<sup>3</sup> Populations exist that are also resistant to group 5 herbicides.

<sup>4</sup> Populations also exist that are resistant to group 2 herbicides.

**TABLE 4-7. Interval Before Rainfall (Postemergence)**

Rainfall shortly after application of a postemergence herbicide may reduce the weed control. This effect varies with the product, the formulation, the interval of time and the drying conditions between application and rainfall, as well as on the amount, intensity and duration of rainfall. The following information is based on label information and additional detail supplied by the chemical industry. For further information, contact the manufacturer. In the case of a tank-mix, use the longest time interval of the products being considered.

<b>0 to 15 Minutes</b>	<b>1 Hour</b>	<b>2 Hours</b>	<b>3 Hours</b>	<b>4 Hours</b>	<b>4 Hours (cont'd)</b>	<b>6 Hours</b>

LOROX	<b>24 Hours</b>					
LOROX	MECOTURF plus 2,4-D					

<sup>1</sup> Indicates herbicides sold as a co-pack under this trade name.

<sup>2</sup> Most glyphosate products do not specify an exact rainfast period, but rather state that "heavy rainfall immediately after application may wash the chemical off the foliage" and to "not apply if rainfall is forecasted for the time of application." Field experience has shown that a 6 hour period of no rainfall after application has generally been adequate for glyphosate to perform adequately.

redroot pigweed

common ragweed

spreading triplex

lamb's-quarters

green foxtail

eastern black nightshade

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

## 5. NOTES ON ADJUVANTS

### Introduction

An adjuvant is any substance added to a spray solution to modify and enhance the effectiveness of the herbicide.

Adjuvants are an important part of the spray solution and if not used will negatively affect the degree of weed control obtained. Some products have adjuvants formulated into the product while other products require that the user add the adjuvant. The selection of adjuvants is key to obtaining the right balance between maximizing weed control and minimizing crop injury. In some cases the rate of adjuvant varies depending on conditions of weather, crop stage, weed species, water quality, etc. Some herbicide labels recommend particular adjuvant products and some recommend particular types of adjuvants. Always use adjuvants as directed on the product label.

Most adjuvant recommendations in this guide are listed as the amount (in litres) added to 1,000 L (L/1,000 L) of spray solution. If you wish to convert to % volume/volume (v/v) use the following conversion:

$$10 \text{ L}/1,000 \text{ L} = 1\% \text{ v/v}$$

There are 2 broad categories of adjuvants:

- activators and spray modifiers, and
- utility modifiers.

### Activators and Spray Modifiers

- **Surfactants** (also known as “surface active agents”) are the largest class of adjuvants. Surfactants can be non-ionic, anionic, cationic or amphoteric. Most surfactants are non-ionic (NIS); that is they do not ionize. A NIS is used to enhance herbicide penetration into a waxy cuticle. Wetting agents and detergents are primarily anionic and when ionized in solution, the water soluble portion is negatively charged. Cationic surfactants exhibit a net positive charge in solution. Amphoteric surfactants can be either anionic or cationic. Cationic and amphoteric surfactants are not widely used in agricultural chemicals.

- **Oils** solubilize the waxy cuticle layer on a weed leaf surface to increase spray penetration through the leaf cuticle. Oils are refined mineral oils (petroleum based) or seed oils. Seed oils are categorized as triglycerides, methylated seed oils (MSO) or crop oil concentrates (COC). Crop oil concentrates are a combination of seed oil and surfactants.

### Utility Modifiers

- **Compatibility** agents improve mixing, especially when using a liquid fertilizer carrier.
- **Drift control** agents increase the droplet size to reduce drift.

- **Anti-foaming/Defoaming** agents are used to reduce and prevent foaming in the spray tank.
- **Foaming** agents are used with specialized equipment to produce and apply foam.
- **Buffering** agents can be used to enhance solubility or adjust pH.
- **Dyes** are used in some instances to enhance visibility of spray foam solutions.

### Note

Complete information on each adjuvant is available on the product label which is located on the product container. The federal Pest Management Regulatory Agency also lists pesticide labels on their website at: [bit.ly/herbicidelabels](http://bit.ly/herbicidelabels).

Many pesticide manufacturers also list product labels and/or Material Safety Data Sheets (MSDS) on their websites that are listed on the last page of this publication.

## **AGRAL 90**

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 90%.

**Registered Uses:** For use with REGLONE, glyphosate, REFLEX and other control products as labeled. Also used for washing sprayer tanks and equipment.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

**Mixing:** Use 200–2,500 mL/1,000 L of water as specified on label. Will mix with all types of water. Add AGRAL 90 to the spray mixture and agitate thoroughly. With glyphosate, use 350 mL/50–100 L water if targeting quackgrass in minimum or zero tillage seeding and summerfallow uses. Use 500 mL/100 L for quackgrass when water volumes are high (i.e. 150–300 L/ha).

**Unique Characteristics:** Do not exceed the recommended rates of AGRAL 90 as too much wetting agent can lead to loss of spray due to excessive run-off.

## **ALLIANCE 400**

**Type of Adjuvant:** Compatibility agent.

**Chemical Composition:** Aliphatic phosphate ester, isopropanol and glycol ethers 69%.

**Benefit:** Emulsifies and disperses liquid fertilizers and emulsifiable pesticides in solution to produce uniform tank-mixes.

**Mixing:** Mix 60–375 mL of Alliance/100 L of solution depending on fertilizer and number of pesticides. Add alliance to the fertilizer solution before the pesticide.

## **AMIGO**

**Type of Adjuvant:** Surfactant.

**Chemical Composition:** 30% phosphate ester surfactant.

AGRAL 90

**Registered Uses:** For use with SELECT and SELECT tank-mixes.

**Benefit:** Improves chemical effectiveness under varying environmental conditions.

**Mode of Action:** Improves spreading of spray droplets on the leaf surface and increases contact area. Enhances penetration of herbicide through the leaf cuticle layer.

**Mixing:** Half-fill spray tank with water and start agitation. Add the correct amount of herbicide, agitate and then add the correct amount of AMIGO with the remaining water. Continue to agitate.

## **AQUASOFT**

**Type of Adjuvant:** Water conditioning agent.

**Chemical Composition:** Proprietary blend of hydroxy carboxylic acid, phosphoric acids and ammonium sulfate polyacrylic acid 63%.

**Benefit:** Eliminates hard water antagonism as well as formulation instability due to high pH.

**Mode of Action:** Conditions water by sequestering and chelating hard water ions and reducing the pH.

**Mixing:** 100–750 mL/100 L of spray solution, depending on water hardness. Always check compatibility with a jar test.

## **AQUA-STABLE**

**Type of Adjuvant:** Buffering agent.

**Chemical Composition:** Aliphatic polycarboxylate and calcium chloride 28%.

**Benefit:** Lowers the pH of the spray water and reduces pesticide breakdown from alkaline spray solutions.

**Mode of Action:** Acidifies and buffers spray solution.

**Mixing:** 60–250 mL/100 L of spray solution, depending on the alkalinity.

## **ASSIST OIL CONCENTRATE**

**Type of Adjuvant:** Mineral oil/surfactant (non-herbicidal).

**Chemical Composition:** 83% paraffin base mineral oil plus 17% surfactant blend.

**Registered Uses:** ASSIST OIL CONCENTRATE is registered for use with BASAGRAN, BLAZER, IMPACT, LADDOK, POAST and atrazine.

**Benefit:** Using ASSIST results in improved postemergence activity and a greater degree of consistency under varying environmental conditions. ASSIST also aids in providing a faster weed kill.

**Mode of Action:** Reduces the evaporation of spray droplets on the leaf surface leading to a longer period for penetration. Improves penetration through the leaf cuticle layer. ASSIST also aids in spreading a spray droplet on the leaf surface so that it covers a greater surface area.

**Mixing:** Half-fill the spray tank with water and begin agitation. Add the desired amount of herbicide and continue filling. Add ASSIST last. After filling, continue agitation. Agitate thoroughly after any stoppage in spraying.

**Unique Characteristics:** May cause increased temporary topical burn to crop plants under hot, humid weather conditions.

## **BREAKER**

**Type of Adjuvant:** Antifoamer/defoamer.

**Registered Uses:** To reduce foaming when preparing herbicide spray mixes.

**Benefit:** Small quantities of BREAKER added before adding herbicides will prevent foam from forming.

**Mixing:** Add 7 mL/500 L of spray mix.

**Unique Characteristics:** Can be added after foam has formed but more time will be required to eliminate the foam.

## **BUFFERING AGENTS**

See AQUA-STABLE.

5. NOTES ON ADJUVANTS

## CITOWETT PLUS

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Octylphenoxy-polyethoxy ethanol 50%.

**Registered Uses:** For use with atrazine, BASAGRAN, TELAR, MUSTER, REFINE, PINNACLE and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a spreading and sticking agent that improves coverage of spray mixes.

## CHOICE

**Type of Adjuvant:** Water conditioning agent.

**Chemical Composition:** Blend of polyacrylic, hydroxy carboxylic, propionic acids, phosphate ester and ammonium sulfate.

**Benefit:** Eliminates hard water antagonism and instability due to high pH.

**Mode of Action:** Conditions water by sequestering or chelating hard water ions and by the reduction in pH.

**Mixing:** 2.5–7.5 L/1,000 mL water.

## COMPANION

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Octylphenoxy-polyethoxy-(9)-ethanol 70%.

**Registered Uses:** Glyphosate, TELAR, MUSTER and other products as labelled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

**Mixing:** With glyphosate, for the control of annual grasses and broadleaf weeds, add 450 mL of COMPANION in 50–100 L of water/ha. With TELAR, add 100 mL of COMPANION to 100 L of water for the control of broadleaf weeds. Use constant agitation.

**Unique Characteristics:** Do not exceed the recommended rates of COMPANION as too much may reduce the effectiveness of the herbicide due to excessive run-off.

## CONTACT

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Alkylarylpolyoxyethylene glycols, free fatty acids and isopropyl alcohol at 900 g/L.

**Registered Uses:** For use with glyphosate\*. TELAR, REFINE, MUSTER and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a spreading and sticking agent that improves coverage of spray mixes.

## COMPATABILITY AGENTS

See ALLIANCE 400, UNITE.

## DEFOAMERS/ANTIFOAMERS

See BREAKER, FIGHTER F, FLAT-OUT, HALT, VALID, ZAP.

## DRIFT-CONTROL AGENTS

See VALID.

## ENHANCE NON-IONIC SPRAY ADJUVANT

**Type of Adjuvant:** Non-ionic multipurpose adjuvant.

**Chemical Composition:** Triglyceride Ethoxylate 80%.

**Registered Uses:** ENHANCE can be used with glyphosates\*, REGLONE, PURSUIT, ACCENT, ULTIM, REFINE and a wide range of other products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** ENHANCE works by several modes of action which results in improving wetting, spreading and penetrative properties.

**Mixing:** Use 200–2,500 mL/1,000 L of water as specified on label. Will mix with all types of water. Add AGRAL 90 to the spray mixture and agitate thoroughly. For use with ROUDNUP and other glyphosates use 350 mL/50–100 L for quackgrass, minimum or zero tillage seeding and summerfallow uses. Use 500 mL/100 L for quackgrass for water volume of 150–300 L/ha.

**Unique Characteristics:** ENHANCE contains no nonylphenoxy polyethoxy ethanol (NPE's). Do not exceed recommended rates of ENHANCE as this may cause run-off.

## FIGHTER F

**Type of Adjuvant:** Antifoamer/defoamer.

**Chemical Composition:** Dimethyl-polysiloxane 10%.

**Registered Uses:** To control foam in water, oil, fertilizer and pesticide spray mixtures.

**Benefit:** Controls foam when mixing sprays, eliminates material waste, provides more accurate metering of agricultural sprays, and eliminates foam overflow at fill site.

**Mixing:** To control foam when mixing spray solution, add defoamer either just before or during addition of any other spray adjuvant. To cut existing foam, add defoamer to tank and recirculate solution until foam dissipates.

## FLAT-OUT

**Type of Adjuvant:** Antifoamer/defoamer.

**Chemical Composition:** Dimethylpolysiloxane 20% Silicone base neutral.

**Registered Uses:** To control foam formation or existing foam, use as premix or add while spray tank is being filled.

\* Numerous products exist, refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

**Benefit:** The reduction of foam allows for faster tank fill, ensures fill volumes are correct and reduces the possibility of chemical overflow, therefore more accurate application. It also makes the cleaning process easier.

**Mixing:** Add 5–10 mL/100 L of solution. Adjust the amount required according to individual conditions. May be used before mixing to prevent foam, or after to cut foam. May be used with any herbicide unless contra-indicated on the label.

## FOAM MARKER DYES

See IN-SIGHT, TRAMLINE, TREKKER TRAX.

## HALT

**Type of Adjuvant:** Defoamer.

**Chemical Composition:** Silicone base, neutral.

**Registered Uses:** To reduce foaming when preparing herbicide spray mixes.

**Benefit:** The reduction of foaming allows faster tank fill-ups, ensures correct fill volumes, reduces the possibility of chemical overflow and gives more accurate herbicide application.

**Mixing:** Add 7 mL/500 L of spray mix. May be added to spray tank during filling to prevent foaming, or after to cut foam.

**Unique Characteristics:** May be used with any herbicide unless otherwise stated on the product label.

## HASTEN NT

**Type of Adjuvant:** Non-ionic esterified vegetable oil.

**Chemical Composition:** Methyl and ethyl oleate 71.44%.

**Registered Uses:** For use with REFINE SG, ESCORT, TELAR and other herbicides as labeled.

**Benefit:** Improves herbicide uptake.

**Mixing:** Use 5 L/1,000 L of spray solution.

## ICON

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 90%.

**Registered Uses:** For use with REGLONE, glyphosate\*, REFLEX and other control products as labeled. Also used for washing sprayer tanks and equipment.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

**Mixing:** Use 200–2,500 mL/1,000 L of water as specified on label. Will mix with all types of water. Add ICON to the spray mixture and agitate thoroughly. With glyphosate, use 350 mL/50–100 L water if targeting quackgrass in minimum or zero tillage seeding and summerfallow uses. Use 500 mL/100 L for quackgrass when water volumes are high (i.e. 150–300 L/ha).

**Unique Characteristics:** Do not exceed the recommended rates of ICON as too much wetting agent can lead to loss of spray due to excessive run-off.

## INDEX

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Alkylarylpolyoxyethylene glycols, free fatty acids and isopropyl alcohol at 900 g/L.

**Registered Uses:** For use with ASSURE, PURSUIT, ULTIM, ACCENT and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a spreading and sticking agent that improves coverage of spray mixes.

## IN-SIGHT

**Type of Adjuvant:** Foam marker dye.

**Active Ingredients:** Dye, surfactants, and coupling agents.

**Uses:** As a colour dye marker for foam markers and as a dye marking agent for turf applications.

**Benefit:** Allows foam marking systems to show up under poor visibility conditions of low light, heavy trash, no-till, snow or fog.

**Mixing:** Use 15–30 mL/100 L of spray solution.

## IPCO AG-SURF

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 92%.

**Registered Uses:** For use with REGLONE, glyphosate\* and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

## LI700

**Type of Adjuvant:** Non-ionic surfactant and pH adjuster/acidifier.

**Chemical Composition:** Phosphatidylcholine, methylacetic acid and alkyl polyoxyethylene ether 80%.

**Registered Uses:** REGLONE and for use with glyphosate products. LI700 neutralizes or slightly acidifies the spray solution and prevents the breakdown hydrolysis of pH-sensitive products in the spray tank. Add LI700 before adding the pesticide.

**Benefit:** Improves chemical effectiveness.

**Mixing:** As a penetrating surfactant: Use 5 L/1,000 L of water or 500 mL/100 L of water. As a pH adjuster/acidifier: Highly alkaline water, (pH 8 or higher). Use: 625 mL–1.25 L/1,000 L water mixture.

\* Numerous products exist, refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

## **MANA X-ACT**

**Type of Adjuvant:** Surfactant.

**Chemical Composition:** 30% phosphate ester surfactant.

**Registered Uses:** For use with ARROW and ARROW tank-mixes.

**Benefit:** Improves chemical effectiveness under varying environmental conditions.

**Mode of Action:** Improves spreading of spray droplets on the leaf surface and increases contact area. Enhances penetration of herbicide through the leaf cuticle layer.

**Mixing:** Half-fill spray tank with water and start agitation. Add the correct amount of herbicide, agitate and then add the correct amount of AMIGO with the remaining water. Continue to agitate.

## **MERGE, MERGE 1**

**Type of Adjuvant:** Surfactant/solvent.

**Chemical Composition:** 50% surfactant blend plus 50% solvent (petroleum hydrocarbons).

**Registered Uses:** For use with ERAGON, IMPACT, POAST ULTRA and other products as labeled.

**Benefit:** Improves chemical effectiveness and provides a greater degree of consistency under varying environmental conditions.

**Mode of Action:** Improves spreading of spray droplets on the leaf surface and increases contact surface area. Improves penetration of herbicide through the leaf cuticle layer. Acts as a protectant against photodegradation of POAST ULTRA by UV light.

**Mixing:** Half-fill spray tank with water, start agitation. Add required amount of herbicide and continue agitation. Add MERGE, along with remaining water, last to the tank. Agitate thoroughly after any stoppage in spraying.

**Unique Characteristics:** May cause temporary topical burn to crop plants under hot, humid weather conditions.

## **MINERAL OIL/SURFACTANT (NON-HERBICIDAL)**

See ASSIST OIL CONCENTRATE, XA OIL CONCENTRATE.

## **N TANK**

**Type of Adjuvant:** Water conditioning and compatibility agent.

**Chemical Composition:** A blend of monocarbamide dihydrogen sulphate, amine phosphates and viscosity reducing agents at 81%.

**Benefit:** Eliminates hard water antagonism. Prevents loss of herbicide activity that can occur when certain micronutrients are tank-mixed with glyphosate.

**Mode of Action:** Conditions water by sequestering and chelating hard water ions and added micronutrients.

**Mixing:** Add 0.25–1 L per 100 L spray solution prior to the addition of micronutrients and certain pesticides, the exception being sulphonylurea herbicides (e.g. ACCENT, PINNACLE SG) which should be added first and fully dissolved prior to adding N TANK. Always check mixing compatibility first with a jar test.

## **NUFARM AG-SURF**

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 92%.

**Registered Uses:** For use with REGLONE, glyphosate\* and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

## **OIL**

See MINERAL OIL.

## **PRO-SURF II**

**Type of Adjuvant:** Non-ionic liquid spreader/activator.

**Chemical Composition:** Alkylarylpolyoxyethylene glycols, free fatty acids and isopropyl alcohol; 900g/L.

**Registered Uses:** For use with PURSUIT, ACCENT, ASSURE II, ULTIM, and other products as labeled.

**Benefit:** Improves spray chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixtures.

**Mixing:** Make sure the spray tank is thoroughly cleaned before mixing. Fill the spray tank half full with water. Add the required amount of herbicide as directed by its label with the agitator running. Ensure that the herbicide is completely mixed before proceeding to the next step. Slowly add the PRO-SURF II, agitating during the entire process. Continue to agitate while filling the tank with water and agitate before and during each application to ensure a uniform spray.

**Unique Characteristics:** Do not exceed recommended rates of PRO-SURF II, as too much may reduce the effectiveness of the herbicide due to excessive run-off. Consult product label for full directions.

## **SENTRY**

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 90%.

**Registered Uses:** For use with REGLONE, glyphosate\* and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

\* Numerous products exist, refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

## SIDEKICK, SIDEKICK II

**Type of Adjuvant:** Non-ionic liquid spreader/activator.  
**Chemical Composition:** Alkylarylpolyoxyethylene glycols, free fatty acids and isopropyl alcohol; 900 g/L.

**Registered Uses:** For use with PURSUIT, ACCENT, ASSURE II, ULTIM and other products as labelled.

**Benefit:** Improves spray chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixtures.

**Mixing:** Make sure the spray tank is thoroughly cleaned before mixing. Fill the spray tank half full with water. Add the required amount of herbicide as directed by its label with the agitator running. Ensure that the herbicide is completely mixed before proceeding to the next step. Slowly add the SIDEKICK II, agitating during the entire process. Continue to agitate while filling the tank with water and agitate before and during each application to insure a uniform spray.

**Unique Characteristics:** Do not exceed recommended rates of SIDEKICK II, as too much may reduce the effectiveness of the herbicide due to excessive run-off. Consult product label for full directions.

## SUFFIX

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 90%.

**Registered Uses:** For use with REGLONE, glyphosate\* and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

## SUPER SPREADER

**Type of Adjuvant:** Non-ionic spreader sticker surfactant.

**Chemical Composition:** Octyl phenoxypoly ethoxy ethanol 50%.

**Registered Uses:** For use with ACCENT, atrazine, BASAGRAN, MUSTER, PINNACLE, TELAR, PRISM, PYRAMIN FL, REFINE EXTRA, REFLEX, ULTIM and other products as labelled.

**Benefit:** Improves postemergence control of weeds that have reached their upper limit in size for susceptibility.

**Mode of Action:** Causes the spray mix to form a continuous film on leaf surfaces; also makes herbicide more rainfast.

**Mixing:** Use 1–2.5 L/ha. Half-fill tank with water; add herbicide with continuous agitation; complete filling of tank with water; add SUPER SPREADER with continuous agitation.

**Unique Characteristics:** Higher rates are required with hard water.

## SURE-MIX

**Type of Adjuvant:** Paraffinic petroleum oil/surfactant (non-herbicidal).

**Chemical Composition:** 60% Paraffinic petroleum oil plus 35.6% surfactant blend.

**Registered Uses:** SURE-MIX is registered for use with ASSURE II, and CLASSIC plus PINNACLE when tank-mixed with ASSURE II.

**Benefit:** The use of SURE-MIX results in improved activity of ASSURE II and a greater degree of consistency under varying environmental conditions.

**Mode of Action:** Reduces the evaporation of spray droplets from the leaf surface and decreases the surface tension of spray droplets thus improving penetration through the cuticle of leaf surfaces.

**Mixing:** Add the required amount of water to the spray tank with agitator running. Add ASSURE II and after well mixed add 5 L of SURE-MIX for each 1,000 L of spray solution.

**Unique Characteristics:** May cause some minor leaf speckling under hot and humid weather conditions.

## SYLGARD 309

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Siloxylated polyether 76% + surfactant mixture 24%.

**Registered Uses:** For use with PURSUIT on soybeans for annual broadleaf and grass control; and glyphosate for quackgrass control and annual broadleaf weed control in summer fallow; and with TORDON 101 for faster burndown of coniferous species on right-of-ways, BASAGRAN on soybeans, VISION SILVICULTURE and VISION MAX SILVICULTURE, VANTAGE FORESTRY, RANMAN 400 SC, FULFILL 50 WG.

**Benefits:** Improves chemical effectiveness by increasing the amount and rate of uptake of water-soluble herbicides.

**Mixing:** Use 2.5 L/1,000 L of spray solution for most applications; add this amount last to the spray tank after the herbicide has been thoroughly mixed. Apply the spray solution as soon as possible after mixing.

**Unique Characteristics:** This organosilicone formulation has lowest surface tension of any adjuvant available.

## TRAMLINE

**Type of Adjuvant:** Foam marker.

**Chemical Composition:** Nonionic and anionic surfactants, 35% + 65% alcohols and other constituents.

\* Numerous products exist, refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

**Benefit:** Improves placement of herbicides by indicating area of field sprayed, preventing overlaps and misses.

**Mixing:** Depending on water hardness and mineral content mix 0.63–1 L/100 L of water.

## TREKKER TRAX

**Type of Adjuvant:** Foam marker.

**Chemical Composition:** 24% alcohols and 30% mixed anionic and nonionic surfactants.

**Benefit:** Improves placement of herbicides by indicating area of field sprayed.

**Mixing:** Depending on water hardness, use 1–2 L/100–150 L water.

## TURBOCHARGE

**Type of Adjuvant:** Surfactant/solvent.

**Chemical Composition:** 39.5% surfactant blend plus 50% solvent (mineral oil).

**Registered Uses:** For use with ACHIEVE 40 DG herbicide.

**Benefit:** Improves chemical effectiveness and provides a greater degree of consistency under varying environmental conditions.

**Mode of Action:** Improves spreading of spray droplets on the leaf surface and increases contact surface area. Improves penetration of herbicide through the leaf cuticle layer.

**Mixing:** Half-fill spray tank with water, start agitation. Add required amount of herbicide and continue agitation. Add TURBOCHARGE along with remaining water last to the tank. Agitate thoroughly after any stoppage in spraying. Use at a rate of 0.5 L TURBOCHARGE/100 L of spray mixture. If tank-mixing with other herbicides, always add the TURBOCHARGE last.

## UNITE

**Type of Adjuvant:** Compatibility agent.

**Chemical Composition:** 83.7% acid polyglycols and methyl alcohol.

**Benefit:** Improves the compatibility of liquid fertilizer-pesticide mixtures.

**Mixing:** 240–1,420 mL/378.5 L. Perform a test of physical compatibility of various pesticides and fertilizer mixtures in a small quantity to determine the exact amount of UNITE and the mixing method to be used.

## VALID

**Type of Adjuvant:** Deposition and drift reduction agent, antifoam-defoamer.

**Chemical Composition:** Lecithin, emulsifiers, glycols and dimethylpolysiloxane defoamer.

**Benefit:** Small quantities of VALID added before adding pesticides will prevent foam from forming. Adding VALID to the spray tank will also reduce the production of fine spray droplets that may drift.

**Mixing:** Mix 125 mL/100 L of spray mixture.

## WATER CONDITIONING AGENTS

See AQUASOFT, CHOICE and N TANK.

## WEEDAWAY AG-SURF

**Type of Adjuvant:** Non-ionic surfactant.

**Chemical Composition:** Nonylphenoxy polyethoxyethanol 92%.

**Registered Uses:** For use with REGLONE, glyphosate\* and other control products as labeled.

**Benefit:** Improves chemical effectiveness.

**Mode of Action:** It is a wetting and spreading agent that improves coverage of spray mixes.

## XA OIL CONCENTRATE

**Type of Adjuvant:** Mineral oil/surfactant (non-herbicidal).

**Chemical Composition:** 83% paraffin-base mineral oil plus 17% surfactant blend.

**Registered Uses:** atrazine, ASSURE, BASAGRAN, LADDOCK and other products as labelled.

**Benefit:** May result in improved postemergence activity.

**Mode of Action:** Reduces the evaporation of spray droplets from the leaf surface and decreases the surface tension of spray droplets, thus improving the penetration through the cuticle of leaf surfaces.

## ZAP

**Type of Adjuvant:** Antifoamer/defoamer.

**Chemical Composition:** Proprietary blend of ingredients.

**Registered Uses:** To control foam formation or existing foam. Use as premix or add while spray tank is being filled. For agricultural/industrial uses.

**Benefit:** The reduction of foam allows for faster tank fill, ensures fill volumes are correct and reduces the possibility of chemical overflow. It also makes the cleaning process easier.

**Mixing:** Add 2–5 mL/100 L of solution. Adjust the amount required according to individual conditions. May be used before mixing to prevent foam, or after to cut foam. May be used with any herbicide unless contra-indicated on the label. Is particularly effective with glyphosate products, which often foam in solution.

\* Numerous products exist, refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

**TABLE 6-2. Preplant Herbicide Weed Control Ratings**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

✓ Indicates species is controlled if emerged.

<sup>1</sup> Optimum growth stages for best control of these weeds will not likely be attained prior to planting in early to mid spring.

<sup>2</sup> Indicates that the herbicide is sold as a co-pack under this trade name.

<sup>3</sup> Use the 1.8 kg/ha of glyphosate for plants over 15 cm tall or across.

<sup>4</sup> Top growth only, regrowth can be expected.

<sup>5</sup> Numerous products exist. Refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

<sup>6</sup> Repeated applications may be necessary.

**TABLE 6-3. Specific Notes on Weeds Controlled and Product Rates Associated with Various Glyphosate Concentrations**

Glyphosate* Concentration	Product Rate/ac	Weeds Controlled & Notes
360 g/L	0.3–1.4 L/ac	• For control of <b>annual weeds</b> .
450 g/L	0.24–1.12 L/ac	• Apply in 50–100 L/ha (20–40 L/ac) of water, or use surfactant with larger water volumes.
480 g/L	0.22–1.05 L/ac	• The highest rate is required for weeds over 15 cm in height.
500 g/L	0.22–1 L/ac	• For weeds smaller than 15 cm in height consult the product label for weed specific rates.
540 g/L	0.2–0.93 L/ac	• For actively growing weeds in the fall, or spring prior to emergence of any crop.
		• Allow 5–7 days translocation time after application before doing any tillage when conditions are good. If cool temperatures follow application, allow additional time for translocation to be completed before disturbing treated weeds.
		• Only weeds emerged at application time will be controlled.
360 g/L	1–2.8 L/ac	• For <b>dandelions</b> and <b>quackgrass</b> .
450 g/L	0.8–2.25 L/ac	• Apply when quackgrass has 3–4 new leaves.
480 g/L	0.75–2.1 L/ac	• The low rate will provide a minimum of one season control while higher rates will provide longer term control of quackgrass.
500 g/L	0.72–2 L/ac	• For dandelions, apply the low rate if smaller than 15 cm in diameter and higher rates if greater than 15 cm in diameter.
540 g/L	0.67–1.87 L/ac	

\* Numerous products exist, refer to Table 4-1. *Herbicides Used in Ontario*, page 29 for a complete list of products.

Use higher water volume on dense vegetation.</li> <li>Perennial weeds will only be suppressed.</li> </ul>
paraquat	0.5 kg/ha		
<b>Stale Seedbed and Inter-Row Weeding</b>			
The stale seedbed technique is useful when the soil can be worked well before planting and weeds are allowed to emerge for several weeks. Apply one of the non-selective postemergent herbicides listed here to kill emerged weeds. Seeding or planting directly into the killed weeds with minimal soil disturbance will allow the crop to establish before the next flush of weed emergence. Follow up with either cultivation, hoeing or postemergent or directed herbicides to control later germinating weeds. Where registered, some herbicides can be applied after seeding but before crop emergence.			
AIM EC (240 g/L) + non-ionic surfactant <i>or</i> MERGE	37–117 mL/ha 2.5 L/1,000 L 1 L/1,000 L	5–47 mL/ac 2.5 L/1,000 L 1 L/1,000 L	<ul style="list-style-type: none"> <li>Apply POST with a hooded sprayer between the rows or between the plastic mulch.</li> <li>Apply to actively growing weeds up to 10 cm tall.</li> <li>Apply in a minimum of 100 L/ha (40 L/ac) water.</li> <li>Apply <b>ONLY</b> once per growing season.</li> <li><b>AIM EC</b> may cause crop injury if the spray is allowed to come in contact with the green stem, leaves, bloom or fruit.</li> <li>Pre-Harvest Interval (PHI) ranges from 1–15 days depending on the crop. Refer to the product label for a specific crop's PHI.</li> <li>Refer to product label or Chapter 4, Notes on Herbicides, page 38 for a list of registered crop uses.</li> </ul>
carfentrazone-ethyl + non-ionic surfactant <i>or</i> surfactant solvent	8.9–28 g/ha 0.25% v/v 0.1 % v/v		
glyphosate*	See Table 6-3	See Table 6-3	<ul style="list-style-type: none"> <li>Till and fertilize soil in early spring.</li> <li>Allow weeds to grow, and spray weeds just before seeding crop.</li> <li>For specific information on product rate and notes for annual and perennial weed control, refer to Table 6-3, Specific Notes on Weeds Controlled and Product Rates Associated with Various Glyphosate Concentrations, page 90.</li> </ul>

glufosinate ammonium	0.405–0.75 kg/ha		

<sup>1</sup> Indicates herbicide sold as a co-pack under this trade name.

\* Numerous products exist, refer to Table 4-1, *Herbicides Used in Ontario*, page 29 for a complete list of products.

**TABLE 6-4. Postharvest Weed Control Ratings**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

Crop Stubble	Treatment	Grasses				Perennial Broadleaf Weeds							
		quackgrass	wine stem muhly	blindweed, field	chickweed, mouse-eared	clover, red	dandelion	hemp dogbane	milkweed	ground cherry	thistle, Canada	sow-thistle

## **Beans (Adzuki, Dry, Lima and Snap)**

Dry beans include black, cranberry, Dutch brown, kidney, mung, otebo, pinto, snap, small red Mexican, yellow eye and white bean market classes.

**Apply all treatments in 150–300 L/ha (60–120 L/ac) water unless otherwise specified.**

When developing a weed control program, consider cultivation, rotation and other cultural practices along with herbicide treatments. Any single method of weed control, or the continuous use of the same chemical, can lead to the build up of weeds resistant or tolerant to that control method. Rotating crops and/or other control methods reduce the chance of developing new or unique weed infestations.

High speed (10–20 km/hr), shallow (2.5–3 cm) cultivation with a rotary hoe when beans are in the 1–2 leaf stage helps control small weed seedlings. This technique does not reduce herbicide action and may, in some years, enhance chemical weed control and improve crop safety.

Inter-row cultivation may be needed when weeds escape herbicide treatment; consider weeds 'escapes' when they are 5–7 cm high. Shallow cultivation

will control the escaped weeds and prevents newly germinated ones from surviving.

Band treatment of chemical over the row reduces costs by one-half to two-thirds, depending on row spacing and width of band. Shallow inter-row cultivation will be required to control weeds between the bands.

Cultivation will give some control of established perennial weeds but may also help to spread them to previously uninfested areas. Machinery sanitation is important when moving from one field to another.

Some chemicals may also be impregnated on dry bulk fertilizer. Check the label for recommended fertilizer ingredients. Please refer to Table 7-1. *Beans (Dry, Lima And Snap) Herbicide Weed Control Ratings*, page 97 to determine which market classes of edible beans are registered for the herbicide treatments listed.

Rates and application techniques vary for trifluralin products. For further information on these and other chemicals refer to label recommendations and also *Notes on Herbicides*, page 38.

### **Herbicide Application Timings**

- **Preplant (PP)** – Also see *Preplant Weed Control, Preplant-Site Preparation Prior To Any Crop*, page 90, for details of products, rates and remarks.

- **Preplant Incorporated (PPI)** – Unless stated otherwise, two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required. Cultivation equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Pay special attention to machinery cleanliness and/or treating fields with perennial weeds last.

- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

## 8. CEREAL CROPS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

**FIGURE 8-1. Cereal Crop Growth Stages**

## Cereals

Apply all treatments in 100–200 L/ha (40–80 L/ac) of water except where otherwise noted.

Crop rotation is a valuable technique used to prevent the build up of weed populations associated with small grain production. Wild oats can increase in population and severely limit production on fields where small grains are grown continuously. Some weeds (e.g., proso millet) will be well controlled by cereal competition.

Blind harrowing with a light harrow, before emergence of cereals, can help to control small germinating weeds. A light harrow can also be used in cereals up to the 3 leaf stage, or a weeder harrow (L shaped flexible tines) at the 4 leaf stage to provide better control of small annual broadleaf weeds. The timing of these harrowing operations is critical. The

weeds must be small and the soil surface must be dry and easily worked.

Weeds must be emerged from the soil surface and in early stages of growth to be killed by the rates of the herbicides used on cereal grains. Weeds that are growing during early periods of cereal growth (up to 5 leaf stage) have the greatest effect on the cereal yield.

The growth stage for maximum safety varies with the cereal and the herbicide. Check the label for appropriate timing. When counting the leaves on cereal plants, some confusion can occur if tiller leaves are present. These leaves are not counted. Figure 8-1, *Cereal Crop Growth Stages*, on this page, is useful for identifying the cereal leaf stages that are mentioned in this chapter.

Cereal grains have an advantage in that they do not make use of the full growing season. This is particularly true of the winter cereals where preplant

cultivation and postharvest cultivation can be used to stimulate germination of weed seeds and reduce perennial weed populations.

## Herbicide Application Timings

- **Preplant (PP)** – Also see *Preplant Weed Control, Preplant-Site Preparation Prior To Any Crop*, page 90, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)**
- **Premergence (PRE)**

**Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicides. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS For more information, see Chapter 4, <i>Herbicides Used In Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 9. CORN (FIELD, SEED & SWEET)

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

**TABLE 9-1. Conventional Corn (Field, Seed and Sweet) Herbicide Weed Control Ratings**

Trade Name	Crop	Annual Grasses								Annual Broadleaves								Perennials				Crop Tolerance

**BOLD** trade names indicate the weed is listed on the product label for control or suppression.

<sup>1</sup> Indicates herbicides sold as a co-pack under this trade name.

## Conventional Corn (Field, Seed and Sweet)

**Critical Stage:** The Critical Stage to control weeds in corn is the 2–8 leaf over stage (3–10 leaf tips).

Apply all treatments in 150–300 L/ha (60–120 L/ac) water unless otherwise specified.

Any single method of weed control or the continuous use of the same herbicides can lead to the build-up of weeds resistant or tolerant to that control method. Triazine-resistant lamb's-quarters and pigweed, for example, are problematic due to continuous corn and repeated use of triazine herbicides. Rotating to other crops and/or other control methods reduces the chance of new or unique weed infestations.

To control small annual weed seedlings, blind harrow with a set of light harrows at a shallow depth before the corn has emerged, or use a weeder harrow (with L-shaped flexible tines) when the crop is 5–10 cm high. High speed (10 km/h), shallow (2.5–3 cm) cultivation with the rotary hoe when corn is 7–8 cm high also helps control small weed seedlings. These techniques will not reduce herbicide action and often enhances weed control. Inter-row cultivation can be used to complement other weed control measures. Row cultivation is most effective when weeds are small. Shallow cultivation will reduce: germination of new weed seeds, moisture loss and corn root injury.

Inter-row cultivation may be required when weeds escape herbicide treatment; consider weeds escapes when they are 5–7 cm high.

Band treatment of a herbicide over the row reduces cost by one-half to two-thirds, depending on the row spacing and width of band. Shallow inter-row

cultivation will be required to control weeds between the bands.

Cultivation gives some control of established perennial weeds but may also help to spread them to previously uninfested areas. Machinery sanitation is important when moving from one field to another. Many perennials (i.e. quackgrass) can be spread on tillage equipment. Machinery operators should be particularly careful when moving from one farm to another.

### Seed Corn Recommendations

Some field corn recommendations are applicable to seed corn, however, certain inbreds are susceptible to some herbicides. Check with the contracting company before applying any herbicide. For information on specific weeds see Table 9-1. *Conventional Corn (Field, Seed and Sweet) Herbicide Weed Control Ratings*, page 119, and then refer to the appropriate section for details about herbicide treatment.

Nitrogen solution can be used as a carrier, instead of water, for preplant and preemergence application of some herbicides. Weed control activity is not increased. Spray before crop emergence. Consult the herbicide label for proper methods of application and use of dispersing agents. Calibrate the sprayer to apply the required amount of nitrogen. Use stainless steel flood jet nozzles of adequate size. Nitrogen solution is mildly corrosive, especially to brass; clean the sprayer immediately after use. UNITE may be used to improve liquid fertilizer herbicide compatibility and stability when a simultaneous application of a liquid fertilizer and liquid or wettable powder herbicide is desired. Because formulations and rates vary, it is essential to read the label to determine the exact amount and method to be used.

Do not apply nitrogen solution with postemergence herbicides as significant crop injury and reduced weed control can occur.

### Special Notes For Corn, Field and Sweet

**PRECAUTIONS:** Do not use 2,4-D, MCPA, MCPB, 2,4-DB or dicamba later than 2 weeks prior to the first appearance of tassels or ear silk. Use extreme care when applying these herbicides near susceptible crops because of possible herbicide movement. Soybeans, tomatoes and tobacco are extremely sensitive to dicamba and injury symptoms may persist for several weeks. Do not use dicamba in the area of susceptible crops when temperatures exceed 25°C on the day of application or if high humidity is expected, due to the possibility of dicamba volatilizing and injuring susceptible crops nearby. Leave several rows of corn unsprayed when adjacent to soybean fields or other susceptible crops.

### Atrazine and Simazine Soil Residues

Atrazine and simazine residues may last for more than one year, particularly if high rates are used more than once and dry weather occurs. If atrazine or simazine is used year after year as in a continuous corn program, triazine residues may be higher. Atrazine when used at rates of 1 kg/ha (active ingredient) or lower on corn do not cause injury to succeeding crops of oats, barley, mixed grains, or soybeans. However certain crops are sensitive when grown the year after Atrazine has been applied at rates above 1 kg/ha (active ingredient). Refer to the product label and Tables 4-4 and 4-5. *Hericide Crop Rotation and Soil pH Restrictions*, page 70 and page 72 for specific rotational crop restrictions.

Injury has been reported on tomatoes, white beans, forage seedlings, peas, tobacco, cucumbers, onions, and turnips following applications of atrazine at more than 1.1 kg/ha (active ingredient) on corn the previous year.

To reduce the hazard of atrazine residues on succeeding crops:

- Fall plowing will reduce triazine injury more than spring plowing will.
- Deeper tillage will reduce the concentration of herbicide in the upper soil area compared to shallow tillage.
- Ensure that the sprayer used is adequate and is properly calibrated and adjusted. Spray uniformly without overlaps and do not spray while the sprayer is stopped.

#### **Herbicide Treatments Include**

- **Preplant (PP)** – Also see *Preplant Weed Control, Preplant-Site Preparation Prior To Any Crop*, page 90, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated on a product's label. Cultivation equipment used for herbicide incorporation are known to spread perennial weeds to previously uninfested areas. Pay special attention toward machinery cleanliness, and/or treating fields with perennial weeds last.
- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing controls weed escapes and improves herbicide activity in the absence of rainfall.
- **Postemergence (POST)** – Apply herbicide when weeds are small and actively growing. Avoid applying herbicides past the maximum weed leaf

stage listed on the label or control will be reduced. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

#### **Corn Leaf Stages**

Counting leaves on a corn plant may sound like an easy task, but there are complications that can cause miscounting. There are several methods of counting leaves. It is important to know which leaf counting method is being referred to.

This publication uses the leaf over method, (see Figure 9-1, page 129) where counting starts with leaves that have emerged from the whorl and the leaf tip is starting to arch over. This normally occurs when leaves are about 50% emerged. Most product labels also use this method of leaf counting, but check the label or with the product representative to be sure. The comparative growth stages table in the next column gives a comparison among the count methods.

Another complication with leaf counting is where on the plant leaf counting begins. In this publication, the first leaf is the bottom leaf of the plant. The first leaf is shorter than other leaves and has a round leaf tip. However, as the plant grows the bottom leaves die and drop to the ground. For example, a 10 leaf corn plant may be incorrectly identified as a 7 leaf corn plant because 3 leaves may be "senesced" or fallen off. These leaves may not be immediately apparent and care must be taken to count them.

**Start counting from the bottom leaf and check the first leaf to look for the rounded leaf tip.**

It takes about 75–80 Crop Heat Units to produce each corn leaf. Therefore at temperatures of 30°C day, and 20°C at night, there is one new leaf every 2–3 days; and at 20°C day, and 10°C at night, one new leaf every 5–6 days.

Some product labels also use plant height to indicate crop growth stages. In general, plant height is more variable depending on plant genetics and on the weather of the season. The following table gives some comparative heights for each leaf stage but individual plants may be slightly more or less than the stage given depending on genetics and weather. The standing height is measured from the ground surface to the top of the plant as it stands. Leaf extended refers to the height of the plant with the leaves pulled up to their full height.

**TABLE 9-3. Comparative Growth Stages**

Leaf Over <sup>1</sup>	Leaf Collar	Leaf Tip <sup>2</sup>	Standing Height (cm)	Leaf Extended (cm)
2	1	3	5–6	5–11
4	3	5–6	9–17	16–25
6	4–5	7–8	18–33	29–46
8	5–6	9–10	36–54	54–77
10	8	12	58–85	86–112
12	10	14–15	99–114	121–149

<sup>1</sup> Number of leaf tips emerged from the whorl.

<sup>2</sup> Number of leaf whorls emerged from the whorl.

#### **Why is Early Season Weed Control so Important in Corn?**

Source: Eric R. Page and Clarence J. Swanton  
Department of Plant Agriculture, University of Guelph

In Ontario, corn yield losses from weed competition can range from 0.3 to 2.2% per day (after the 3<sup>rd</sup> leaf tip stage, Figure 9-2. *The Effect of Weed Competition on Corn Yield Potential*, page 129). The timing and severity

FIGURE 9-1. Leaf Over Method of Counting Corn Leaves

of these yield losses varies from site to site and year to year, which greatly complicates weed control measures. Much of this variability can be attributed to two key factors: (1) the time at which the weeds emerged relative to the crop, and (2) the density of the weed population. The relative importance of these factors in determining yield losses has been the subject of several studies, including one by Bonic and Swanton (1997) on the competitiveness of barnyard grass (*Echinochloa crus-gali* (L.) P. Beav.) with corn. Interestingly, the results of this study demonstrated that the density of a weed population was far less important in determining crop yield losses than the time at which the weeds emerged (Figure 9-3. *The Effect of Weed Density and Time of Emergence on Corn Yield Potential*). For instance, 60 barnyard grass seedlings emerging when the corn was at the 1 leaf stage reduced yield by 12%, whereas if the same number of seedlings emerged when the corn was at the 4 leaf stage the yield loss was only 3%. It is clear from these results that weed emerging at or near the time of crop emergence have the greatest potential to reduce crop yield and thus, should be considered the most important targets of weed control practices.

Our most recent research has focused on understanding why the timing of weed emergence

FIGURE 9-2. The Effect of Weed Competition on Corn Yield Potential

The data points along the line represent the yield potential of the crop when weeds were controlled at the corresponding days after planting. Adapted from Hall, Swanton and Anderson (1992).

FIGURE 9-3. The Effect of Weed Density and Time of Emergence on Corn Yield Potential

Adapted from Bosnic and Swanton (1997).

is so important in determining yield losses in corn. Based on the established critical period for weed control and the result of Bosnic and Swanton (1997) (*Figure 9-3. The Effect of Weed Density and Time of Emergence on Corn Yield Potential*, page 129), we know that later emerging weeds often have much less effect on corn yield potential. Furthermore, good agronomic practices (e.g. seedbed preparation, fertilization, planting depth, etc.) should ensure that crop seedlings have access to abundant resources for the duration of early seedling development. How then, if resources are plentiful, do early season crop-weed interactions reduce grain yields?

It is possible that crop-weed competition actually begins before resources become limiting. In fact, it is well established that plants perceive and respond to neighbouring competitors before any shading occurs. This response, called shade avoidance, is based on light signals reflected from the leaves of nearby plants and serves as an early warning system of impending competition. Shade avoidance causes plants to grow taller and put more resources into shoot growth at the expense of developing their root system. This temporary shift in resource allocation may enable plants to overtop their competitor and capture more of the incoming light. In natural ecosystems, shade avoidance provides a competitive advantage and increases the chance of survival to reproduction. Conversely, shade avoidance in agricultural systems may reduce crop yield potential by increasing plant-to-plant variability within a crop stand.

Stand uniformity has long been regarded as a key component to maximizing crop yield potential. In corn, yield potential is closely associated with kernel number per plant (KNP) and thus, it is not surprising that yield losses from early season weed competition

**FIGURE 9-4. The Number of Kernels per Ear of Plants in Corn Stands That Developed Under Simulated Weedy or Weed-Free Conditions, Respectively (E. Page unpublished data)**

Dashed lines indicate the mean kernel number per ear for each population.

causes a reduction in KNP. In a recent experiment, we examined whether weed-induced shade avoidance, without direct competition for resources, could explain the yield losses associated with early season weed competition. Indeed, it was clear from the results of this study that shade avoidance alone reduced the mean KNP by 7% and, perhaps more importantly, it doubled the plant-to-plant variability in KNP (*Figure 9-4. The Number of Kernels per Ear of Plants in Corn Stands That Developed Under Simulated Weedy or Weed-Free Conditions, Respectively*, on this page).

We contend that early season weed competition causes yield losses in corn by increasing the plant-to-plant variability in KNP. This effect will persist even after weed removal and will seldom be noticed visually as it

occurs without changing the mean size of the plants in the crop stand. Under favourable growing conditions, modest reductions in KNP may be compensated for by increases in kernel weight, such that yield losses are minimized. However, if the crop experiences subsequent stresses (e.g. direct competition for resources, drought, etc.), yield losses may reflect the cumulative effects triggered by shade avoidance and subsequent stresses. We suggest that it is for this reason that weeds emerging with the crop are more competitive than later emerging weeds. Furthermore, the interactions of shade avoidance, direct competition and environmental stresses may account for the variability in yield losses observed from site-to-site and year-to-year.

## CONVENTIONAL CORN (FIELD, SEED AND SWEET)

### Preplant Burndown and Residual Control

- Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a "one pass" weed management program.
- Refer also to Chapter 6, *Preplant & Postharvest Weed Control*, page 87 for preplant application rates for glyphosate and GRAMAXONE.
- It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. AATREX, CONVERGE 480, MARKSMAN/PROPERO, PRIMEXTRA II MAGNUM) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.

### Soil Applied Grass and Broadleaf Herbicides (Preemergence Timing Only)

INTEGRITY (668 g/L)	1.1 L/ha	0.44 L/ac	<ul style="list-style-type: none"><li>Apply PPI or PRE.</li></ul>

# GLYPHOSATE TOLERANT (“ROUNDUP READY”) CORN

## Weed Management Strategies for Glyphosate Tolerant Corn

There are four main strategies that one can use to manage weeds in glyphosate tolerant corn.

1. A single application of glyphosate.
2. Glyphosate tank-mixed with a residual herbicide.
3. Two in-crop applications of glyphosate.
4. A preemergence application with a residual herbicide followed with an in crop application of glyphosate.

Public research trials evaluated the performance of these four strategies at 11 locations over 2 growing seasons. Yield data from these trials are presented in Table 9-4. *Corn Yield From Different Weed Management Strategies in Glyphosate Tolerant Corn*, on this page, as a percentage of the top yielding treatment. In general, all four strategies can provide maximum yields in any given field provided it offers excellent weed control from the 3–8 leaf stage of corn.

**TABLE 9-4. Corn Yield From Different Weed Management Strategies in Glyphosate Tolerant Corn**

Strategy	Pros	Cons	Yield (%)
<b>Two Pass Glyphosate</b> glyphosate applied at the 3–4 leaf stage of corn and again at the 7–8 leaf stage of corn	<ul style="list-style-type: none"><li>• Typically provides the best weed control and corn yields.</li><li>• Better perennial weed control.</li></ul>	<ul style="list-style-type: none"><li>• More expensive.</li><li>• Increases selection pressure of glyphosate and chance of selecting herbicide resistant weed populations.</li></ul>	100
<b>PRE/POST</b> residual herbicide applied PRE followed by glyphosate applied at the 7–8 leaf stage of corn	<ul style="list-style-type: none"><li>• Typically provides the best weed control and corn yields.</li><li>• Multiple herbicide modes of action to manage resistant weed populations.</li><li>• Better perennial weed control.</li></ul>	<ul style="list-style-type: none"><li>• More expensive.</li></ul>	99
<b>One Pass Tank-Mix with Residual Herbicide</b> glyphosate + residual herbicide applied at the 3–4 leaf stage of corn	<ul style="list-style-type: none"><li>• Only one application.</li><li>• Multiple herbicide modes of action to manage resistant weed populations.</li></ul>	<ul style="list-style-type: none"><li>• Timing too early to control many perennial weeds.</li><li>• Reduced weed control when tank-mix partner does not provide residual control of weed spectrum in the field.</li></ul>	97
<b>One Pass Glyphosate (Early)</b> glyphosate applied at the 3–4 leaf stage of corn	<ul style="list-style-type: none"><li>• Only one application.</li></ul>	<ul style="list-style-type: none"><li>• Season long weed control not always possible.</li><li>• Weeds emerging after application can significantly reduce yield.</li></ul>	96
<b>One Pass Glyphosate (Late)</b> glyphosate applied at the 7–8 leaf stage of corn	<ul style="list-style-type: none"><li>• Not recommended.</li></ul>	<ul style="list-style-type: none"><li>• Not recommended.</li></ul>	90

Yield data collected from 11 replicated trials during the 2007 and 2008 growing seasons.

**TABLE 9-5. Glyphosate Tolerant (“Roundup Ready”) Corn Herbicide Weed Control Ratings**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

#### Preplant Burndown and Residual Control

- Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a "one pass" weed management program.
- Refer also to Chapter 6, *Preplant & Postharvest Weed Control*, page 87 for preplant application rates for glyphosate and GRAMAXONE.
- It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. AATREX, CONVERGE 480, MARKSMAN/PROPERO, PRIMEXTRA II MAGNUM) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.

#### Preemergence Herbicides with Limited Residual Weed Control – May Require a Postemergence Glyphosate Application (Glyphosate Tolerant Hybrids Only)

BATTALION <sup>1</sup>			
ELIM EP (25 DF)	50 g/ha	20 g/ac	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn.
+ DUAL II MAGNUM (915 g/L)	0.625 L/ha	0.25 L/ac	• See precautions for BATTALION, page 134.
+ BANVEL II (480 g/L)	0.625 L/ha	0.25 L/ac	• A postemergence application of glyphosate applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
rimsulfuron	12.5 g/ha		
+ s-metolachlor/benoxacor	573 g/ha		
+ dicamba	300 g/ha		
CONVERGE XT <sup>1</sup>			
CONVERGE FLEXX (240 g/L)	220 mL/ha	89 mL/ac	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn.
+ CONVERGE 480 (480 g/L)	1.1 L/ha	+ 0.44 L/ac	• Use for early season weed control through the critical crop establishment phase.
isoxaflutole	52.5 g/ha		• Use in a planned weed management program with a post-emergent glyphosate application.
+ atrazine	532 g/ha		• See precautions for CONVERGE XT, page 134.
INTEGRITY (668 g/L)	0.73 L/ha	0.292 L/ac	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn.
saflufenacil/dimethenamid-P	488 g/ha		• A postemergence application of glyphosate applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
PRIMEXTRA II MAGNUM (1:0.8) 720 g/L	2.5 L/ha	1 L/ac	• See precautions for INTEGRITY, page 131.
s-metolachlor/benoxacor/atrazine	1.8 kg/ha		• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn.
PROWL 400 (400 g/L) or PROWL H2O (455 g/L)	2.5 L/ha	1 L/ac	• The reduced rate of PRIMEXTRA II MAGNUM (1 L/ac) provides suppression of labeled weeds and is part of a planned weed management program that includes a follow-up postemergence treatment of glyphosate.
+ AATREX (480 g/L)	2.2 L/ha	0.89 L/ac	
	2.1 L/ha	0.83 L/ac	
pendimethalin	1 kg/ha		• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn.
+ atrazine	1 kg/ha		• A postemergence application of glyphosate applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
			• See precautions for PROWL alone, page 137 and AATREX alone, page 132.

<sup>1</sup> Indicates product sold as a co-pack under this trade name.

\* Numerous products exist. Refer to Table 9-7, *Glyphosate Product Rates, Manufacturer, Rainfast and Salt Type Labeled for Use on Glyphosate Tolerant ("Roundup Ready") Corn*, page 152 for a complete list.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
PROWL 400 (400 g/L) <b>or</b> PROWL H2O (455 g/L)	2.5 L/ha 2.2 L/ha	1 L/ac 0.89 L/ac	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn.
+ MARKSMAN (393 g/L)	2.5 L/ha	1 L/ac	• A postemergence application of glyphosate applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
<b>One Pass Postemergence Non-Residual Herbicides for Glyphosate Tolerant Hybrids Only</b>			
glyphosate (360 g/L)* <b>or</b> other glyphosate products	2.5–5 L/ha See Table 9-7	1–2 L/ac See Table 9-7	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn. See Table 9-7, <i>Glyphosate Product Rates, Manufacturer, Rainfast and Salt Type Labeled for Use on Glyphosate Tolerant ("Roundup Ready") Corn</i> , page 152, for a list of registered glyphosate products.
glyphosate	0.9–1.8 kg/ha		• Apply up to and including the 8 leaf stage of corn. • Applications should be timed to keep the corn crop weed-free from the 3–8 leaf stage of corn.
<b>One Pass Postemergence Tank-Mixes with Residual Control for Use in Glyphosate Tolerant Corn Only</b>			
GALAXY 2 <sup>1</sup> ULTIM (75 DF) + POLARIS (360 g/L)	33g/ha 2.5 L/ha	13 g/ac 1 L/ac	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn. • Apply from the spike to the 6 leaf stage of corn. • Use on corn with corn heat units (CHU) greater than 2,500. • <b>Water Volume:</b> 140–190 L/ha. • Provides residual control of fall panicum, green foxtail, lamb's-quarters and pigweed spp. • Tank-mix with CALLISTO for improved residual broadleaf weed control.
nicosulfuron/rimsulfuron + glyphosate	25 g/ha 0.9 kg/ha		
glyphosate (360 g/L)* <b>or</b> other glyphosate products + AATREX (480 g/L)	2.5 L/ha See Table 9-6 1.56–2.1 L/ha	1 L/ac See Table 9-6 0.63–0.85 L/ac	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn. • Apply up to and including the 5 leaf stage of corn. • Atrazine will provide residual control of broadleaf weeds.
glyphosate + atrazine	0.9 kg/ha 0.75–1.0 kg/ha		
glyphosate (360 g/L)* <b>or</b> other glyphosate products + CALLISTO (480 g/L) + AATREX (480 g/L) + non-ionic surfactant	2.5 L/ha See Table 9-7 0.21 L/ha 0.58 L/ha 2 L/1,000 L	1 L/ac See Table 9-7 0.085 L/ac 0.235 L/ac 2 L/1,000 L	• Use <b>ONLY</b> with pedigreed (certified) corn seed designated as glyphosate tolerant or "Roundup Ready" corn. • Apply up to and including the 8 leaf stage of corn. • CALLISTO and Atrazine will provide residual broadleaf weed control.
glyphosate + mesotrione + atrazine + non-ionic surfactant	0.9 kg/ha 0.1 kg/ha 0.28 kg/ha 0.2% v/v		

<sup>1</sup> Indicates product sold as a co-pack under this trade name.

# GLUFOSINATE TOLERANT (“LIBERTY LINK”) CORN

## Weed Management Strategies for Glufosinate Tolerant Corn

There are four main strategies that one can use to manage weeds in glufosinate tolerant (“Liberty Link”) corn.

1. A single application of LIBERTY.
2. LIBERTY tank-mixed with a residual herbicide.
3. Two in-crop applications of LIBERTY.
4. A preemergence application with a residual herbicide followed with an in crop application of LIBERTY.

Grain yield and weed control associated with any of the above four strategies is similar to what has been observed by the University of Guelph in glyphosate tolerant corn, refer to Table 9-8. *Glufosinate (“Liberty Link”) Tolerant Corn Herbicide Weed Control Ratings*, on this page. In general, Liberty provides optimum weed control under hot humid conditions, when applications are made during the day (versus the morning or evening) and when spray coverage is thorough. Cool conditions, weed size, and dew on weed leaves will reduce the level of control of Liberty even at labeled rates.

**TABLE 9-8. Glufosinate (“Liberty Link”) Tolerant Corn Herbicide Weed Control Ratings**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g., too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

Trade Name	Annual Grasses								Annual Broadleaves								Perennials				Crop Tolerance

— Insufficient information available to make a rating.

**BOLD** numbers indicate the weed is listed on the product label for control or suppression.

<sup>1</sup> For use on "Liberty Link" (glufosinate tolerant) corn only.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.
--	---	--------------------------	--

#### Preplant Burndown and Residual Control

- Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a one pass weed management program.
- Refer also to Chapter 6, *Preplant & Postharvest Weed Control*, page 87 for preplant application rates for glyphosate and GRAMAXONE.
- It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. atrazine, CONVERGE PRO, PRIMEXTRA II MAGNUM) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.

#### Preemergence Herbicides with Limited Residual Weed Control – May Require a Postemergence Application of LIBERTY 200 SN ("Liberty Link") Hybrids Only

BATTALION <sup>1</sup>			
ELIM EP (25 DF)	50 g/ha	20 g/ac	• Use <b>ONLY</b> on glufosinate tolerant ("Liberty Link") corn hybrids. • See precautions for BATTALION, page 134.
+ DUAL II MAGNUM (915 g/L)	0.625 L/ha	0.25 L/ac	
+ BANVEL II (480 g/L)	0.625 L/ha	0.25 L/ac	• A postemergence application of LIBERTY applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
rimsulfuron	12.5 g/ha		
+ s-metolachlor/benoxacor	573 g/ha		
+ dicamba	300 g/ha		
CONVERGE XT <sup>2</sup>			
CONVERGE FLEXX (240 g/L)	220 mL/ha	89 mL/ac	• Use <b>ONLY</b> on glufosinate tolerant ("Liberty Link") corn hybrids.
+ CONVERGE 480 (480 g/L)	1.1 L/ha	0.44 L/ac	• Use for early season weed control through the critical crop establishment phase.
 			• Use in a planned weed management program with a post-emergent application of LIBERTY 200 SN.
isoxaflutole	52.5 g/ha		• See precautions for CONVERGE XT, page 134.
+ atrazine	532 g/ha		
INTEGRITY (668 g/L)	0.73 L/ha	0.292 L/ac	• Use <b>ONLY</b> on glufosinate tolerant ("Liberty Link") corn hybrids.
 			• A postemergence application of LIBERTY applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
saflufenacil/dimethenamid-P	488 g/ha		• See precautions for INTEGRITY, page 131.
PRIMEXTRA II MAGNUM ((1:0.8) 720 g/L)	2.5 L/ha	1 L/ac	• Use <b>ONLY</b> on glufosinate tolerant ("Liberty Link") corn hybrids.
 			• The reduced rate of PRIMEXTRA II MAGNUM (1 L/ac) provides suppression of labeled weeds and is part of a planned weed management program that includes a follow-up postemergence treatment of LIBERTY.
s-metolachlor/benoxacor/ atrazine	1.8 kg/ha		
PROWL 400 (400 g/L)	2.5 L/ha	1 L/ac	• Use <b>ONLY</b> on glufosinate tolerant ("Liberty Link") corn hybrids.
or PROWL H2O (455 g/L)	2.2 L/ha	0.89 L/ac	• A postemergence application of LIBERTY applied at the 7–8 leaf stage of corn may be necessary for the control of perennial weeds or weed escapes.
+ AATREX (480 g/L)	2.1 L/ha	0.83 L/ac	• See precautions for PROWL alone, page 137 and AATREX alone, page 132.
pendimethalin	1 kg/ha		
+ atrazine	1 kg/ha		

<sup>1</sup> Indicates product sold as a co-pack under this trade name.

\* Numerous products exist. Refer to Table 9-7, *Glyphosate Product Rates, Manufacturer, Rainfast and Salt Type Labeled for Use on Glyphosate Tolerant ("Roundup Ready") Corn*, page 152 for a complete list.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 10. FORAGE CROPS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

## FORAGE GRASSES (SEED PRODUCTION ONLY)

Herbicide Treatments include:

- **Preplant (PP)** – Also see *Preplant Weed Control, Preplant-Site Preparation Prior To Any Crop*, on page 90 for details of products, rates and remarks.
  - **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.
  - **Preemergence (PRE)**
  - **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.
- Apply all treatments in 100–200 L/ha (40–80 L/ac) water except where otherwise noted.**

### Postemergence Grass Herbicides

ACHIEVE LIQUID (400 g/L) + TURBOCHARGE <b>or</b> BISON (400 g/L) + ADDIT ADJUVANT	0.5 L/ha 0.5 L/100 L	0.2 L/ac 0.5 L/100 L	<ul style="list-style-type: none"> <li>• Apply to wild oats, volunteer oats, green foxtail and yellow foxtail prior to tillering. Applications made to weeds that have tillered may result in unacceptable control.</li> <li>• <b>For the following forage grasses grown for seed only:</b> <ul style="list-style-type: none"> <li>– Seedling and established intermediate and crested wheatgrass, creeping red fescue, meadow and smooth bromegrass either underseeded to cereals or grown alone.</li> <li>– For establishment of northern wheatgrass, western wheatgrass and slender wheatgrass.</li> <li>• <b>Do NOT</b> tank mix ACHIEVE LIQUID with any other herbicides, insecticides, fungicides, fertilizers, micronutrients or adjuvants other than those listed on the label.</li> </ul> </li> </ul>
tralkoxydim + adjuvant	0.2 kg/ha 0.5% v/v

## PASTURE RENOVATION WITH BIRD'S-FOOT TREFOIL

The introduction of this legume into a pasture requires control of competition from weeds and forage grasses for the first 2–4 months after the legume seed begins to germinate. Control of established perennial weeds should start at least one year before the legume seeding operation. Treatments recommended in Chapter 6 of this publication could be used. If the field cannot be plowed and worked to prepare a seedbed, one of the following chemical treatments can be used to suppress the sod.

The success of these programs depends on many management factors such as inoculation of the trefoil seed as well as control of fertility and grazing.

### Postemergence Grass and Broadleaf Herbicides

glyphosate (360 g/L)* or glyphosate (450 g/L)* or glyphosate (480 g/L)* or glyphosate (500 g/L)* or glyphosate (540 g/L)*	4.75–12 L/ha 3.8–9.6 L/ha 3.56–9 L/ha 3.42–8.64 L/ha 3.17–8 L/ha	1.9–4.8 L/ac 1.52–3.84 L/ac 1.42–3.6 L/ac 1.37–3.46 L/ac 1.27–3.2 L/ac	<ul style="list-style-type: none"> <li>• Apply when the forage grasses have at least 2 leaves.</li> </ul>
glyphosate	1.71–4.32 kg/ha		

\* See Table 4-1, *Herbicides Used in Ontario*, page 29, for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
GRAMOXONE (200 g/L)	5.5 L/ha	2.2 L/ac	For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.
paraquat	1.1 kg/ha		<ul style="list-style-type: none"> <li>• Broadcast seed and fertilizer in mid-April.</li> <li>• Apply GRAMOXONE in early May when the grass is 5–10 cm high before the legume seed germinates.</li> </ul>
<b>PASTURES (MOSTLY GRASSES)</b>			
<p><b>Biennials:</b> Unless otherwise noted, most chemicals are best applied in early fall to first year growth or in late spring to second year growth.</p> <p><b>Perennials:</b> Unless otherwise noted, apply in late spring (end of May to mid-June) when weeds are actively growing. Overgrazing tends to thin the grass stand and allows the establishment of weeds. Undergrazing allows weeds like wild carrot to form and spread seed. Timely mowing can prevent the ripening of weed seeds and reduce the distance these seeds spread with the wind.</p> <ul style="list-style-type: none"> <li>• Chemicals are available to control most of the troublesome weeds in grass pastures and these can give faster kill of established weeds than any other management practice. A chemical may have to be applied more than once to kill established perennial weeds and the new crop of weeds that emerges through a thin grass stand. A poor grass stand can be improved by using a combination of chemicals, fertility and grazing management.</li> <li>• Extend chemical weed control into fencerows and other areas around the pasture to keep these areas from becoming sources of weed seeds.</li> <li>• Generally, clovers are severely damaged by chemical treatments. However, white clover and black medic show some resistance and re-establish quickly.</li> <li>• Consult the label to determine the period of time to keep livestock out of the treated area.</li> <li>• Prevent grazing where poisonous plants (water hemlock, buttercup, chokecherry, etc.) may be made more attractive to livestock after the chemical treatment. It is a good practice to prevent grazing on the field for at least a week after spraying to reduce the chances of the livestock consuming harmful plants.</li> <li>• Apply chemical treatments in at least 200 L/ha (80 L/ac) water and increase this rate if it is necessary to contact weeds through dense vegetation.</li> <li>• Avoid drift or vapour drift from 2,4-D or dicamba onto susceptible crops by using drift reducing techniques such as high spray volume, coarse droplets or anti-drift nozzles.</li> </ul>

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

# 11. SOYBEANS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

**TABLE 11-2. Additional Weed Control Ratings in Conventional Soybean**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Trade names shown in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

Weed Species	Timing	Herbicides (control rating – out of 10)

Unifoliate

First Trifoliate

Second Trifoliate

Third Trifoliate

## Soybeans

Unless otherwise specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

Thoroughly clean all equipment used to apply non soybean herbicides (e.g. ACCENT, LONTREL, MARKSMAN, 2,4-D etc.) immediately after use, as well as before spraying soybeans. See *Cleaning the Sprayer*, on page 16.

**Total Weed Control System** – Although herbicides themselves may be effective, there is a benefit to using other methods of weed control. Crop rotation, herbicide rotation, early weed control with a rotary hoe, harrowing, cultivating and preventing the spread of weeds as much as possible are all a part of weed management. See Chapter 9, *Corn (Field, Seed & Sweet)*, on page 119, for details of each of these methods.

**Resistant Weeds** – Biotypes of a number of weeds have been found resistant to Group 5 (triazine), Group

2 herbicides (e.g. PURSUIT) and Group 9 herbicides (e.g. ROUNDUP). Weed species that are resistant to a particular herbicide treatment are identified in the weed control rating tables with a subscript “R”, meaning that the identified herbicide treatment will not control a biotype that is resistant but a weed rating without the subscript “R” will, provided the rating indicates a control level of 8 or higher.

### Herbicide Treatments Include:

- **Preplant (PP)** – See *Preplant Weed Control, Preplant – Site Preparation Prior to any Crop*, on page 90, for details of products, rates and remarks.
- **Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Ensure machines are clean and/or treat fields with perennial weeds last.
- **Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improves herbicide activity in the absence of rainfall.
- **Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
<b>CONVENTIONAL (NON-GMO) SOYBEAN</b>			
Preplant Burndown Herbicides – For Weed Control Ratings refer to Table 11-4. Soybean Herbicide Weed Control Ratings in Glyphosate Tolerant Soybeans, page 203. Refer also to Chapter 6, Preplant & Postharvest Weed Control, page 87.			
• Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a “one pass” weed management program.			
• Refer to Chapter 6, Preplant & Postharvest Weed Control, page 87 for preplant application rates for glyphosate and GRAMAXONE.			
• It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. SENCOR) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.			
CLEANSTART PLUS <sup>1</sup>			
CREDIT PLUS (360 g/L) + AIM EC (240 g/L)	2.5 L/ha 73 mL/ha	1.0 L/ac 30 mL/ac	• Apply to actively growing weeds, up to 10 cm. • Coverage of weed foliage is essential for control. • Only weeds emerged at application will be controlled. • CLEANSTART PLUS <sup>1</sup> provides no residual weed control. • CLEANSTART PLUS <sup>1</sup> is a co-pack of CREDIT PLUS and AIM EC.
glyphosate + carfentrazone-ethyl	0.9 kg/ha 0.0175 kg/ha		
ERAGON (70% SG) + glyphosate (360 g/L)* + MERGE	36 g/ha 2.5 L/ha 1 L/ha	14.4 g/ac 1 L/ac 0.4 L/ac	• Apply PP ONLY, up to 21 days before planting. • Do NOT use rates higher than 36 g/ha (14.4 g/ac) or crop injury may result.
saflufenacil + glyphosate + adjuvant	25.2 g/ha 900 g/ha 1 L/ha		
ERAGON (70% SG) + PURSUIT (240 g/L) + glyphosate (360 g/L)* + MERGE	36 g/ha 0.42 L/ha 2.5 L/ha 1 L/ha	14.4 g/ac 0.168 L/ac 1 L/ac 0.4 L/ac	• Apply PP ONLY, up to 21 days before planting. • Do NOT use rates higher than 36 g/ha (14.4 g/ac) or crop injury may result. • Refer to precautions for PURSUIT, page 190.
saflufenacil + imazethapyr + glyphosate + adjuvant	25.2 g/ha 0.1 kg/ha 900 g/ha 1 L/ha		
GUARDIAN <sup>1</sup>			
POLARIS (360 g/L) + CLASSIC (25 DF)	2.5 L/ha 36 g/ha	1 L/ac 14 g/ac	• Apply as a PP burndown. • Some rotational restrictions apply (see CLASSIC label and Table 4-4. Herbicide Crop Rotation and Soil pH Restrictions: Field Crops, page 70). • GUARDIAN is a co-pack of POLARIS + CLASSIC. • Some GUARDIAN co-pack's may contain TOUCHDOWN TOTAL instead of POLARIS. If you have a co-pack that contains TOUCHDOWN TOTAL, it should be applied at a rate of 1.8 L/ha (0.72 L/ac).
glyphosate + chlorimuron-ethyl	0.9 kg/ha 9 g/ha		

<sup>1</sup> Indicates herbicides sold as a co-pack under this trade name.

\* Numerous products exist, refer to Table 11-6. Glyphosate Products Rates, Manufacturer, Rainfast and Salt Type Labeled for Use on Glyphosate Tolerant "Roundup Ready" Soybean, page 206 for a complete list of registered products.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS

# GLYPHOSATE TOLERANT (“ROUNDUP READY”) SOYBEAN

## Weed Management Strategies for Glyphosate Tolerant Soybean

University of Guelph research trials have shown that when weed competition is high, two applications of glyphosate in glyphosate tolerant soybeans maximized yields and gross returns over 5 years at multiple locations in Ontario.

**TABLE 11-3. Soybean Yield From Different Weed Management Strategies In Glyphosate Tolerant Soybeans**

Time of Glyphosate Application	Weed Control (% visual)	Yield (%)
Preplant followed by a Post application at the 1–3 trifoliolate stage	96	100
Unifoliolate followed by a Post application at the 1–3 trifoliolate stage	96	98
Post at the 1–3 trifoliolate stage (no Preplant Burndown applied)	93	83

Source: Swanton and Deen, 1999, University of Guelph.

In fields with historically low weed pressure and where the in-crop glyphosate application is not delayed past the 3<sup>rd</sup> trifoliolate stage there is little benefit to applying a residual herbicide. In fields with historically high weed pressure and when there is a risk of delayed in-crop glyphosate application (for reasons such as poor spraying conditions or a large amount of acres over a large geographic area) the application of a residual herbicide will minimize any risk of yield losses due to early season weed competition. It is important to select a residual herbicide that addresses the weed spectrum in your field. Refer to the weed control ratings for soil applied herbicide in Table 11-1. *Conventional Soybean Herbicide Weed Control Ratings*, page 179.

## Glyphosate Resistant Weeds

- **Giant Ragweed** – Populations resistant to glyphosate exist in southwestern Ontario. University of Guelph research has shown that, to date, a preplant application of ERAGON + glyphosate + MERGE is the most effective way to control emerged glyphosate resistant giant ragweed

prior to seeding. FIRSTRATE provides the best control of glyphosate resistant giant ragweed postemergence in glyphosate tolerant soybeans. However, there are populations of giant ragweed that are also resistant to group 2 herbicides such as FIRSTRATE.

- **Canada Fleabane** – Populations resistant to glyphosate exist in Ontario. University of Guelph research has shown that when Canada fleabane has emerged prior to soybean planting, a tank-mix of glyphosate with either AMITROL 240 (see Chapter 6. *Preplant & Postharvest Weed Control*, page 87), BROADSTRIKE RC, ERAGON + MERGE, FIRSTRATE or SENCOR will effectively control glyphosate resistant Canada fleabane. When glyphosate resistant Canada fleabane is present in an emerged glyphosate-tolerant soybean crop, FIRSTRATE is the most effective herbicide, followed by CLASSIC.

**TABLE 11-4. Soybean Herbicide Weed Control Ratings in Glyphosate Tolerant Soybeans**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings shown in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

## GLUFOSINATE TOLERANT (“LIBERTY LINK”) SOYBEAN

### Weed Management Strategies for Glufosinate Tolerant Soybean

Strategies for weed management in glufosinate tolerant soybeans are similar to those outlined for glyphosate tolerant soybeans on page 202.

**TABLE 11-7. Soybean Herbicide Weed Control Ratings in Glufosinate Tolerant (“Liberty Link”) Soybeans**

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings shown in **BOLD** indicate the weed is listed on the product label for control or suppression. Always refer to the product label for more information on registered weed species, product uses and precautions.

Trade Name	Grasses								Annual Broadleaves										Perennials					Crop Tolerance				
	barnyard grass	crabgrass	fall panicum	foxtail, giant	foxtail, green	foxtail, yellow	witchgrass	proso millet	buckwheat, wild	cocklebur	fleabane, Canada	lady's thumb	lamb's-quarters	mustards	nightshades, annual	pigweeds	ragweed, common	ragweed, giant	velvetleaf	bindweed, field	horsetail	milkweed	nutsedge	quackgrass	sow-thistle

– Insufficient information available to make a rating.

<sup>R</sup> Indicates populations resistant to this herbicide exist in Ontario and won't be adequately controlled if present.

**BOLD** numbers indicate the weed is listed on the product label for control or suppression.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.			

**Preplant Burndown Herbicides – Refer also to Chapter 6, *Preplant & Postharvest Weed Control*, page 87.**

- Non-selective herbicides such as glyphosate and GRAMAXONE are used to control emerged weeds prior to no-till planting. Tank-mixing of a residual herbicide with glyphosate or GRAMAXONE can be used to improve application efficiency with a “one pass” weed management program.
- Refer to Chapter 6, *Preplant & Postharvest Weed Control*, page 87 for preplant application rates for glyphosate and GRAMAXONE.
- It is also important to note that when targeting perennial weeds, the addition of a triazine-based herbicide (i.e. SENCOR, LOROX L) will reduce the level of activity achieved with glyphosate. Increasing the rate of glyphosate should overcome this antagonism.

**One Pass Strategies**

LIBERTY 200 SN (200 g/L)	2.5 L/ha	1 L/ac	<ul style="list-style-type: none"> <li>Use <b>ONLY</b> on soybean varieties that are tolerant to LIBERTY 200 SN.</li> <li>LIBERTY 200 SN can be applied from the cotyledon to flowering stage of soybean.</li> <li>LIBERTY 200 SN is a contact herbicide and has no residual activity.</li> <li>Ammonium sulphate can be applied at 6 L/ha (2.4 L/ac) (liquid) or 3.3 kg/ha (1.3 kg/ac) (dry) for improved control of specific weeds.</li> <li><b>Do NOT</b> add oil or any other surfactants.</li> </ul>
glufosinate ammonium	0.5 kg/ha

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 12. OTHER FIELD CROPS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

<sup>1</sup>Can be used on this crop.<sup>2</sup>Insufficient information available to make a rating.<sup>3</sup>BOLD numbers indicate the weed is listed on the product label for control or suppression.<sup>4</sup>Indicates populations resistant to this herbicide exist in Ontario and won't be adequately controlled if present.<sup>1</sup>Use only on crops planted with certified canola seed designated as "Roundup Ready" canola. See Table 4-2. Glyphosate Products, Registered Uses and Rates Needed, page 69 for a complete list of registered products.<sup>2</sup>Use only on crops planted with certified canola seed designated as "Liberty Link" canola.<sup>3</sup>Use only on crops planted with certified canola seed designated as "Pursuit Tolerant" canola products.<sup>4</sup>Various formulations available, see Table 4-1, Herbicides Used in Ontario, page 29. See label for specific uses and rates.

**Herbicide Treatments Include:**

- Preplant (PP)** – Also see *Preplant Weed Control, Preplant – Site Preparation Prior to any Crop*, page 90, for details of products, rates and remarks.
- Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation

is known to spread perennial weeds to previously uninfested areas. Ensure machines are clean and/or treat fields with perennial weeds last.

- Preemergence (PRE)** – Rainfall of 15–20 mm within 10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improves herbicide activity in the absence of rainfall.

- Postemergence (POST)** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are usually more sensitive to herbicide injury. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.

prosulfuron + dicamba + non-ionic surfactant <u>or</u> crop oil concentrate	10 g/ha + 0.14 kg/ha 0.2% v/v 1% v/v		

## SUNFLOWERS

- Cultural control of weeds in sunflowers can be used successfully, but only if weeds are also controlled in other crops in the rotation. There are several tillage options in the sunflower crop.
- Preplant tillage can control 1 or 2 flushes of early germinating weeds. Plant sunflowers immediately after the last tillage operation.
- A rotary hoe set to cultivate shallow can be effective in removing annual weeds that are just emerging. It is not very useful for controlling well-rooted seedlings.
- Spring tooth harrows can be used to control small weeds when sunflowers are in the 4–6 leaf stages. There will be some damage to sunflowers and larger weeds will not be well controlled.
- One or 2 cultivations with a row crop cultivator are the most common form of cultural control. Sunflowers have to be big enough to withstand burial. Lateral roots on sunflowers are shallow, so avoid cultivating too deep or too close to plants.

### Sunflowers – Soil Applied Grass Herbicides

EPTAM (800 g/L)	4.25 L/ha	1.7 L/ac	<ul style="list-style-type: none"> <li>• Apply PPI.</li> <li>• <b>Do NOT</b> use on light sandy soils with less than 3% organic matter.</li> </ul>
EPTC	3.4 kg/ha		
TREFLAN EC (480 g/L) <u>or</u> RIVAL (500 g/L)	1.25–2.4 L/ha 1.2–2.3 L/ha	0.5–0.96 L/ac 0.48–0.92 L/ac	<ul style="list-style-type: none"> <li>• Apply PPI.</li> </ul>
trifluralin	0.6–1.155 kg/ha		

### Sunflowers – Postemergence Grass Herbicides

POAST ULTRA (450 g/L) + ASSIST <u>or</u> MERGE	0.32–0.47 L/ha 2 L/ha 1 L/ha	0.13–0.19 L/ac 0.8 L/ac 0.4 L/ac	<ul style="list-style-type: none"> <li>• Treat the 1–6 leaf stage of annual grass.</li> <li>• For annual grasses and volunteer cereals.</li> <li>• Use the higher rate when volunteer cereals are present.</li> <li>• Use MERGE for conditions or weeds requiring medium to high rates of POAST ULTRA.</li> <li>• Flax is tolerant at any stage of growth.</li> <li>• Apply using 110–200 L/ha of water (44–80 L/ac).</li> </ul>
sethoxydim + oil concentrate <u>or</u> surfactant/solvent	0.15–0.2 kg/ha 2 L/ha 1 L/ha		

<sup>1</sup> Indicates product sold as a co-pack under this trade name.

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. See label for specific uses and rates.

TRADE NAME, (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	• PRECAUTIONS
POAST ULTRA (450 g/L) + MERGE	1.1 L/ha 1-2 L/ha	0.45 L/ac 0.4-0.8 L/ac	• For quackgrass control. Thorough preplant tillage will ensure more uniform quackgrass emergence. • Apply using 100–200 L/ha of water (40–80 L/ac).
sethoxydim + surfactant/solvent	0.5 kg/ha		
SELECT (240 g/L) + AMIGO or ARROW (240 g/L) + X-ACT ADJUVANT	0.13–0.38 L/ha 5–10 L/1,000 L	0.05–0.15 L/ac 5–10 L/1,000 L	• Apply when the annual grasses and volunteer cereals are in the 2–6 leaf stages. • Apply to quackgrass in the 2–5 leaf stages. Use the higher rate for control of quackgrass. • Allow 72 days between application and harvest.
clethodim + surfactant	0.03–0.09 kg/ha 0.5–1% v/v		
VENTURE L (125 g/L)	0.6 kg/ha	0.24 L/ac	• This rate is for control of volunteer corn only. • Apply at 2–5 leaf stage of the volunteer corn.
fluazifop-p-butyl	0.075 kg/ha		
VENTURE L (125 g/L)	1.0–1.4 L/ha	0.4–0.57 L/ac	• Apply at 2–4 leaf stage of annual grasses and at 3–5 leaf stage quackgrass.
fluazifop-p-butyl	0.125–0.18 kg/ha		
<b>Sunflowers – Harvest-Aid</b>			
REGLONE DESICCANT (240 g/L) + AGRAL 90	1.25 L/ha  1 L/1,000 L	0.5 L/ac  1 L/1,000 L	• REGLONE may be used to reduce the period of time from maturity to harvest, to speed up harvesting, and decrease seed moisture at harvest. • Spray when seeds reach maturity (20–50% seed moisture). • Combine 15–20 days after spraying. • Beware of drift to adjacent crops or plants. • See Chapter 4, <i>Herbicides Used in Ontario</i> , page 27, for comments on aerial application.
diquat + surfactant	0.3 kg/ha 0.1% v/v		

## TOBACCO

### Tobacco – Post Transplant Herbicides

Apply in 150–300 L/ha (60–120 L/ac) water.

DEVRINOL DF (50 DF)	2.25–4.5 kg/ha	0.9–1.8 kg/ac	• Apply immediately following transplanting in a 25–30 cm band over the transplants. • Use lower rates on lighter soils. • For best results, lightly incorporate or apply irrigation if rainfall does not occur within 2 days of application. • After harvest, soil should be worked at right angles to the rows to prevent injury to succeeding crops. Small grains may be seeded in the fall to prevent soil erosion. These grains may be stunted but not otherwise affected.
napropamide	1.125–2.25 kg/ha		

<sup>1</sup> Indicates product sold as a co-pack under this trade name.

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
VENTURE L (125 g/L)	0.6–1 L/ha	0.24–0.4 L/ac	For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.
fluazifop-p-butyl	0.075–0.125 kg/ha		• May be applied up to 45 days to harvest.

<sup>1</sup> Indicates product sold as a co-pack under this trade name.

\* See Table 4-1, *Herbicides Used in Ontario*, page 29, for formulations available. See label for specific uses and rates.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

## 13. VEGETABLE CROPS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Crop tolerance ratings are E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

**BOLD** numbers indicate the weed is listed on the product label for control or suppression.

– Insufficient information available to make a rating.

1 Good control of these perennial weeds may require two applications, 7–10 days apart.

2 Yellow foxtail will only be suppressed.

3 Registered for control of hairy nightshade.

4 Repeated applications may be necessary if regrowth occurs.

\* Various formulations available, see Table 4-1. *Herbicides Used in Ontario*, page 29.

<sup>4</sup> Repeated applications may be necessary if regrowth occurs.

\* Various formulations available, see Table 4-1. *Herbicides Used in Ontario*, page 29.

More than 50 vegetable crops are grown commercially in Ontario. Some are seeded, some transplanted, some are annuals, and other crops are perennial, presenting a very diverse group of situations to manage weeds. Weed management involves all aspects of weed control in vegetable crops including scouting, herbicides, cultivation, hoeing, mulches, etc.

Perennial weeds are often a more severe problem in perennial horticultural crops, such as asparagus and need to be controlled prior to planting.

Recommendations for snap beans and sweet corn are listed in the field crop section (Beans, page 97 and Corn, page 119) because they are similar to those for field corn and field beans. Differences are noted where necessary.

Treatments listed for horticultural crops in this publication are based on extensive research trials. Do not use herbicides in cold frames or greenhouses unless specifically recommended.

Horticultural crops are often high value crops. Weed competition is costly. Improper application of herbicides can also be costly. Sprayers used for hormone type herbicides (2,4-D, etc.) should not be used to apply insecticides, fungicides or other herbicides on susceptible horticultural crops.

## **Herbicide Application Timings**

### **Preplant (PP) Treatments**

Preplant treatments are applied before the crop is sown or planted. Some of these herbicides kill seedlings soon after germination while others also kill weed seeds. Most herbicides used for these treatments must be thoroughly incorporated into the soil by cultivation soon after application. Check the label. Also see *Preplant Weed Control, Preplant – Site Preparation Prior to any Crop*, page 90 for details of products, rates and remarks.

### **Preplant (PP) Weed and Cover Crop Control**

Control cover crops and emerged weeds before seeding or transplanting vegetable crops. Refer to Table 6-1, *Non-Selective Herbicides Available for Preplant Site Preparation*, page 87. Alternatively, a grower may choose to kill the cover crop and/or emerged weeds just before planting the vegetable crop and either till the area or leave the seedbed untilled.

### **Preplant Incorporated (PPI)**

Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness and/or treating fields with perennial weeds last.

### **Preemergence (PRE)**

Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improves herbicide activity in the absence of rainfall. These materials prevent emergence of many weed seedlings without reducing crop stand. Apply immediately after seeding or at least before the emergence of the crop. If these materials are applied after weeds have emerged, kill is usually poor. Best results are obtained with this method when conditions for weed seed germination are good.

### **Postemergence (POST)**

These chemicals are applied after the crop plants have sprouted or after the crop has been transplanted. Applied as directed, the weeds can be killed without injury to the crop. Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally

easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

### **Inter-Row Weeding**

The herbicide is directed between the crop rows onto the emerged weeds. The herbicide is used as a rescue operation where other methods of weed control have failed. Use special low pressure (7–15 kpa) applicators such as dribble bars or vibra jets equipped with shields to prevent wetting the crop. See *Stale Seedbed and Inter-Row Weeding*, page 92.

### **Stale Seedbed Technique**

The stale seedbed technique is useful when the soil can be worked well before planting and weeds are allowed to emerge for several weeks. Apply one of the non-selective herbicides listed under the *Stale Seedbed and Inter-Row Weeding*, page 92. Seeding or planting directly into the killed weeds with minimal soil disturbance will allow the crop to establish before the next flush of weed emergence. Follow up with either cultivation, hoeing or postemergent or directed herbicides to control later germinating weeds. Where registered, some herbicides can be applied after seeding but before crop emergence.

### **Wiper Applicators for Selective Weed Control**

Wiper applicators (rope-wick, roller applicator or similar device) have been extensively used with glyphosate (ROUNDUP). Check product labels for use of this application technique with other herbicides.

<b>CUCUMBER</b>			

Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.

#### Preplant (Stale Seedbed Technique)

glyphosate (360 g/L)*	0.75–3.5 L/ha	0.3–1.4 L/ac	• Till and fertilize soil in early spring, and then allow weeds to grow. • Spray weeds just before seeding the crop. • Use low rate for small weeds (8 cm), medium rates for weeds 8–15 cm and higher rate for weeds over 15 cm tall. • Apply recommended PRE or POST herbicides to control new flushes of weeds or use mechanical means of control.
or glyphosate (480 g/L)*	0.56–2.6 L/ha	0.22–1 L/ac	
or glyphosate (500 g/L)*	0.5–2.5 L/ha	0.21–1 L/ac	
or glyphosate (540 g/L)*	0.5–2.3 L/ha	0.2–0.92 L/ac	
glyphosate	0.267–1.246 kg/ha		

#### Soil Applied Grass Herbicide

DUAL II MAGNUM (915 g/L)	1.2–1.5 L/ha	0.5–0.7 L/ac	• Apply POST. • Use the higher rate for heavier weed populations. • Apply in 100–300 L/ha water by ground application equipment <b>ONLY</b> .
s-metolachlor/benoxacor	1.1–1.4 kg/ha		
PREFAR (480 g/L)	12–14 L/ha	4.8–5.6 L/ac	• PPI – For mineral soils <b>ONLY</b> . • Incorporate thoroughly into the soil to a depth of 2.5–5 cm. • Apply in 100–500 L/ha water, <b>ONLY</b> once a year.
bensulide	5.76–6.72 kg/ha		

#### Soil Applied Grass and Broadleaf Herbicides

COMMAND 360 ME (360 g/L)	0.78–1.17 L/ha	0.31–0.47 L/ac	• Apply PRE, after seeding but before crop emergence, <b>ONLY</b> once per year. <b>Do NOT</b> incorporate. • For light textured soils – Apply COMMAND at 0.78 L/ha. <b>Do NOT</b> apply to sandy soil. • For heavy textured soils – Apply COMMAND at 1.17 L/ha. • Some rotational cropping restrictions apply (see Table 4-4, <i>Herbicide Crop Rotation and Soil pH Restrictions - Field Crops</i> , page 70). • Apply in 95–375 L/ha water. • <b>Do NOT</b> harvest for 45 days after application.
clomazone	0.28–0.42 kg/ha		
DACTHAL W-75 (75 WP)	9–15.5 kg/ha	3.6–6.2 kg/ac	• Apply only when cucumber plants have 4–5 true leaves, are well established and growing conditions are favourable for good plant growth otherwise crop injury may result. • Apply PRE prior to weed seed germination. If weeds have emerged, cultivate the soil before application. • Apply at a rate of 9–13.5 kg/ha (3.6–5.4 kg/ac) on light sand or sandy loam soils. • Apply at a rate of 11–15.5 kg/ha (4.4–6.2 kg/ac) on medium silt loam soils. • <b>Do NOT</b> use on muck soils. • Apply in at least 225 L/ha (90 L/ac) of water. • Rainfall or irrigation (about 1cm) is necessary for activation.
chlorthal dimethyl	6.75–11.625 kg/ha		

\* See Table 4-1, *Herbicides Used in Ontario*, page 29, for formulations available. Not all formulations registered on all crops. See label for specific uses and rates.

			• Apply to actively growing weeds up to 10 cm tall.
			• Apply in a minimum of 100 L/ha (40 L/ac) water.
			• Do NOT apply closer than 1 day to harvest.
			• Apply ONLY once per growing season.
			• Apply to actively growing broadleaf weeds at the 1–4 leaf stage.
			• Apply in 200–300 L water/ha (80–100 L water/ac).
			• Apply at 275 kPa.
			• Use ONLY 1 ground application per year.
			• Do NOT use flood jet nozzles.
			• Do NOT spray at temperatures above 25°C.
			• Do NOT apply closer than 58 days to harvest.

## GINSENG

Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.

### Preplant or Prior to Crop Emergence (Stale Seedbed Technique)

glyphosate (360 g/L)*	2.5 L/ha	1.0 L/ac	• Apply POST to weeds once in the spring but before the crop has emerged above the soil.
or glyphosate (480 g/L)*	1.86 L/ha	0.75 L/ac	• Apply in 50–100 L water/ha.
or glyphosate (500 g/L)*	1.8 L/ha	0.72 L/ac	• Do NOT exceed rate or spray volume as crop injury may result.
or glyphosate (540 g/L)*	1.67 L/ha	0.67 L/ac	• Do NOT contact actively growing ginseng foliage.
glyphosate	0.75–0.9 kg/ha		• Do NOT use a fall application in existing/established gardens.

### Postemergence Grass Herbicides

VENTURE L (125 g/L)	0.6–2 L/ha	0.24–0.8 L/ac	• Apply POST up to 3 times/year: early May, late June and/or mid-August.
fluazifop-p-butyl	0.075–0.25 kg/ha		• Apply to actively growing grasses prior to tillering. • Do NOT apply in the year of harvest. • Apply through ground application only.

### Postemergence Broadleaf Herbicides

AIM EC (240 g/L)	36.5–117 mL/ha	14.6–46.8 mL/ac	• Apply POST with a hooded sprayer between the rows.
+ AGRAL 90	2.5 L/1,000 L	2.5 L/1,000 L	• Apply to actively growing weeds up to 10 cm tall.
or AG-SURF	2.5 L/1,000 L	2.5 L/1,000 L	• Apply in a minimum of 100 L/ha (40 L/ac) water.
or MERGE	1 L/1,000 L	1 L/1,000 L	• Do NOT apply closer than 1 day to harvest.
carfentrazone-ethyl	8.8–28.1 g/ha		• Apply ONLY once per growing season.
+ non-ionic surfactant	0.25% v/v		
or surfactant/solvent	0.1% v/v		

\* See Table 4-1. Herbicides Used in Ontario, page 29, for formulations available. Not all formulations registered on all crops. See label for specific uses and rates.

## ONIONS

### Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.

Most experience with herbicides below has been with the seeded crop. Experience with sets and limited experience with Spanish onions have been satisfactory. On green bunching onions, the granular formulations (applied when the leaves are dry) help to avoid leaf injury.

### Soil Applied Grass and Broadleaf Herbicides

CHATEAU WDG (51.1%)	0.14 kg/ha	0.056 kg/ac	<ul style="list-style-type: none"> <li>• Apply <b>ONCE</b> per season.</li> <li>• Apply to transplanted onions between the 2–6 leaf stage and on direct seeded onions between the 3–6 leaf stage prior to weed emergence.</li> <li>• Apply to coarse and medium textured soils with less than 5% organic matter and to muck soils.</li> <li>• Apply using ground application <b>ONLY</b>.</li> <li>• <b>DO NOT</b> apply through irrigation equipment.</li> <li>• Severe crop injury will result when soils are flooded or poorly drained following application and/or if applications are made under cool, wet conditions.</li> <li>• After use, tanks and nozzles must be cleaned with a 3% ammonia solution. Please review label for more detailed instructions.</li> <li>• <b>Do NOT</b> harvest within 45 days of treatment.</li> </ul>
DACTHAL W-75 (75 WP)	9–18 kg/ha	3.6–7.2 kg/ac	<ul style="list-style-type: none"> <li>• PRE – Apply immediately after seeding or directly over transplants, preemergence to weeds.</li> <li>• Apply at a rate of 9–13.5 kg/ha (3.6–5.4 kg/ac) on light sand or sandy loam soils.</li> <li>• Apply at a rate of 11–15.5 kg/ha (4.4–6.2 kg/ac) on medium silt loam soils.</li> <li>• Apply at a rate of 18 kg/ha (7.2 kg/ac) on heavy clay soils.</li> <li>• <b>Do NOT</b> use on muck soils.</li> <li>• Apply in at least 225 L/ha (90 L/ac) of water.</li> <li>• If weeds have emerged, cleanly cultivate the soil before application.</li> <li>• Rainfall or irrigation (about 1 cm) is necessary for activation.</li> </ul>

MCPB/MCPA	1.1–1.7 kg/ha		

## PEPPERS

### Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.

All treatments should be applied in 150–300 L/ha (60–120 L/ac) water. Discussion of cultural methods can be found in the Tomatoes (*Transplanted*) section, page 275. Weed control in peppers is best accomplished by combining chemical and cultural methods.

## POTATOES

### Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.

The best weed management system for potato uses a combination of chemical weed control with cultivation and other techniques. Cultivation prior to potato emergence using various kinds of cultivation equipment (light harrows, finger weeder, hillers, etc.) will control the early flush of weeds. Root pruning of the crop should be minimized. If the crop is hilled after application of herbicides, untreated soil will surface and another flush of weeds may result.

**POTATO VINE KILLING** – For information on products and rates of application of vine killing, consult OMAFRA Publication 838, *Vegetable Crop Protection Guide*, and follow the product label.

### Soil Applied Grass Herbicides

DUAL II MAGNUM (915 g/L)	1.25–1.75 L/ha	0.5–0.7 L/ac	<ul style="list-style-type: none"> <li>PRE or PPI (for nutsedge control).</li> <li>Do NOT use on the variety Superior.</li> <li>Do NOT apply on sandy or coarse textured soils low in organic matter.</li> <li>Do NOT apply at ground crack or if potatoes have emerged.</li> </ul>
s-metolachlor/benoxacor	1.14–1.6 kg/ha		
EPTAM (800 g/L)	4.25–8.5 L/ha	1.7–3.4 L/ac	<ul style="list-style-type: none"> <li>PPI – Apply to a dry soil surface before planting and incorporate immediately, at next to the last or last cultivation for grass escapes. Use at 1.7–2.2 L/ac.</li> <li>Avoid wet soil conditions or weed control may be poor.</li> <li>Use 2.2–3.4 L/ac rates for heavy weed infestations and nutsedge control.</li> </ul>
EPTC	3.4–6.8 kg/ha		

### Soil Applied Broadleaf Herbicides

carfentrazone-ethyl + non-ionic surfactant <b>or</b> surfactant/solvent	8.8–28.1 g/ha 0.25% v/v 0.1% v/v		

## SUGAR BEETS (PROCESSING)

**Caution about Herbicide Residues** – Sugar beets are one of the most sensitive crops to herbicide residues from the previous year's crop. They are particularly sensitive to residues from many of the Group 2 herbicides, including PURSUIT, BROADSTRIKE, CLASSIC and PEAK. Low soil pH (below 6.0) or high soil pH (above 7.5) can be a factor to delay the breakdown of these herbicides, increasing crop injury in rotational crops. Please see Table 4-4. *Herbicide Crop Rotation and Soil pH Restrictions – Field Crops*, page 70, as well as product labels and your herbicide and sugar company representatives for more details on your situation.

**Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.**

#### Soil Applied Broadleaf Herbicides

PYRAMIN FL (430 g/L)	8.25–10.25 L/ha	3.3–4.1 L/ac	<ul style="list-style-type: none"> <li>• Apply PPI or PRE.</li> <li>• <b>Do NOT</b> incorporate more than 5 cm deep.</li> <li>• <b>Do NOT</b> apply to soils with less than 3% organic matter.</li> </ul>

COMMAND 360 ME (360 g/L)	1.55 L/ha	0.62 L/ac	<ul style="list-style-type: none"> <li>• Apply as a single application post transplant surface applied to the crop and prior to weed emergence.</li> <li>• Do NOT incorporate.</li> <li>• Apply in a minimum of 95 L/ha (38 L/ac) of water.</li> <li>• Do NOT apply closer than 95 days to harvest.</li> </ul>
clomazone	0.558 kg/ha		
DACTHAL W-75 (75 WP)	9–18 kg/ha	3.6–7.2 kg/ac	<ul style="list-style-type: none"> <li>• PRE.</li> <li>• Apply at a rate of 9–13.5 kg/ha (3.6–5.4 kg/ac) on light sand or sandy loam soils.</li> <li>• Apply at a rate of 11–15.5 kg/ha (4.4–6.2 kg/ac) on medium silt loam soils.</li> <li>• Apply at a rate of 18 kg/ha (7.2 kg/ac) on heavy clay soils.</li> <li>• Do NOT use on muck soils.</li> <li>• Apply in at least 225 L/ha (90 L/ac) of water.</li> <li>• Apply directly over transplants, preemergence to weeds.</li> <li>• If weeds have emerged, cleanly cultivate the soil before application.</li> <li>• Rainfall or irrigation (about 1 cm) is necessary for activation.</li> </ul>
chlorthal dimethyl	6.75–13.5 kg/ha		

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. Not all formulations registered on all crops. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.
<b>Postemergence Broadleaf Herbicides</b>			
AIM EC (240 g/L)	36.5–117 mL/ha	14.6–46.8 mL/ac	
+ AGRAL 90	2.5 L/1,000 L	2.5 L/1,000 L	• Apply POST with a hooded sprayer between the rows.
or AG-SURF	2.5 L/1,000 L	2.5 L/1,000 L	• Apply to actively growing weeds up to 10 cm tall.
or MERGE	1 L/1,000 L	1 L/1,000 L	• Apply in a minimum of 100 L/ha (40 L/ac) water.
carfentrazone-ethyl	8.8–28.1 g/ha		• Do NOT apply closer than 1 day to harvest.
+ non-ionic surfactant	0.25% v/v		• Apply ONLY once per growing season.
or surfactant/solvent	0.1% v/v		
<b>Postemergence Grass and Broadleaf Herbicides</b>			
POAST ULTRA (450 g/L)	0.32–1.1 L/ha	0.13–0.44 L/ac	• Apply using 100–200 L/ha (40–80 L/ac) water volume.
+ MERGE	0.25–2.0 L/ha	0.1–0.8 L/ac	• For annual grass, use 0.32 L/ha. Apply at the 1–6 leaf stage.
sethoxydim	0.14–0.5 kg/ha		• For volunteer grains, use 0.47 L/ha.
+ surfactant/solvent	0.25–2 L/ha		• For quackgrass, use 1.1 L/ha. Apply up to the 3 leaf stage. Thorough preplant tillage will ensure more uniform quackgrass emergence. Cultivate after 7 days in wide row crops. Use the high rate of MERGE for quackgrass.
			• Do NOT apply if rain is expected within 1 hour after application.
			• Do NOT apply closer than 30 days to harvest.

## TOMATOES (TRANSPLANTED)

Weed control in tomatoes usually consists of a combination of herbicide weed control and cultivation. Crop rotation is also beneficial in the control of weeds. Cultivation should be shallow to prevent bringing untreated soil to the surface, which may result in another flush of weeds. When tomatoes are grown on raised beds and beds are reshaped during the course of the season, it may be necessary or useful to apply another herbicide treatment to areas between the rows to prevent a new weed infestation from interfering with harvesting. Do not exceed the total recommended rate per season of any herbicide applied more than once per year. Band treatment of herbicides over the row will reduce the cost by one-half to two-thirds depending on the width of the band compared to the row spacing. Shallow inter-row cultivation will be required for weed control between the rows. Perennial weeds may be partially controlled by cultivation. Controlling perennial weeds in crops other than tomatoes when grown in rotation is the best approach to control. Perennials are easily spread with cultivators or tillage equipment. Till areas of perennial weeds last. Machinery sanitation is important when moving between fields.

### Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.

Apply all treatments in 150–300 L/ha (60–120 L/ac) water unless otherwise specified.

#### Soil Applied Grass Herbicides

DUAL II MAGNUM (915 g/L)	1.25–1.75 L/ha	0.5–0.7 L/ac	• Use ONLY on transplant tomatoes grown for processing. • Apply PPI. Incorporate shallowly to maintain spatial separation between herbicide treated zone and developing tomato roots.
s-metolachlor/benoxacor	1.14–1.6 kg/ha		• Do NOT use on muck, peat, high organic matter soils. • Do NOT use on soils with less than 1% organic matter. • Use the higher rate for heavier weed populations, eastern black nightshade and yellow nutsedge.

\* See Table 4-1, *Herbicides Used in Ontario*, page 29, for formulations available. Not all formulations registered on all crops. See label for specific uses and rates.

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 14. BERRY CROPS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavourable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

## Cultural Weed Control in Berry Crops

A successful weed control program must integrate cultural and chemical weed control practices. Growers cannot depend entirely on chemical weed control in berry crops, since there is a limited spectrum of herbicides registered for these crops.

### Perennial Weed Control

It is important to identify and control perennial weeds in the preplanting year. It is very difficult to control perennial weeds once a planting is established because of crop sensitivity to some herbicides and since it is not possible to clean cultivate in established berry crops.

The following perennial weeds present serious problems in these crops: quackgrass, bindweed, vetch, wild grape, perennial nightshade, thistles, ground-ivy (creeping charlie) and burdock. In strawberries, sheep sorrel, toad flax and milkweed also present problems.

Systemic herbicides such as glyphosate (e.g. ROUNDUP) or amitrole (e.g. AMITROL 240) should be applied to perennial weeds in the preplanting year. Consult the product label and be sure to use the recommended rate for the weed in question. Apply the herbicide at the proper stage of growth of the weed, otherwise only temporary control will be achieved. Repeated cultivation of some perennial weeds such as bindweed will also provide control.

### Site Preparation

A green manure crop such as perennial ryegrass, Sudan grass, oilseed radish, tillage radish or mustards should be established in the preplanting year following or in conjunction with measures to control perennial weeds. This crop will provide competition to reduce weed growth as well as improve the soil structure.

Non-selective herbicides can be applied before planting the green manure crop and before plowing it under. Short residual selective herbicides such as 2,4-D may be used with the green manure crop, but avoid using herbicides that leave a soil residue that will carry over into the planting year. See Chapter 6, *Preplant – Site Preparation Prior to any Crop*, page 90.

### Mulching

For bramble and bush fruit, biodegradable plastic mulch could be used for weed control in the planting strip. Straw mulch will also assist in weed control beneath the plants or in the planting strip if it is applied early in the season before the weed seeds germinate. Use mulch that is free of weed seeds and ensure that enough nitrogen is provided for the plants. The mulch should be pulled away from around the plants for winter rodent protection.

For strawberries, use of straw mulch before weeds germinate can help control weeds. Some growers are trying plasticulture as a way to improve weed control.

### Reducing Weed Pressure

Cultivation can provide weed control between the rows. In bramble and bush fruit, a vigorous sod between the rows will prevent weeds from becoming established. It is better to seed in a fescue sod rather than rely on a natural sod composed of weed and grass species, because the weeds will seed into the herbicide strip.

Prevent weeds from setting seed in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from flowering. Try to control weeds that escape before they set seed, by cultural removal or chemical mowing. In some situations, tools such as a weed whip may be of use. Mowers are available which will cut close to the plants without

injury. Mowing, however, will not eliminate weed competition.

### Rotating Herbicide Families

(See Table 4-5. *Herbicide Crop Rotation and Soil pH Restrictions: Horticultural Crops*, page 72).

In perennial crops, rotation of herbicide families is important to minimize the build up of seed from weed escapes, including triazine tolerant weeds. Rotation will also help avoid an accumulation of herbicide residues in the soil that may result in crop injury over a period of years and may hinder replanting.

### Herbicide Application Timings

#### Preplant (PP) Treatments

Preplant treatments are applied before the berry field is planted. Some of these herbicides kill seedlings soon after germination while others also kill weed seeds. Most herbicides used for these treatments must be thoroughly incorporated into the soil by cultivation soon after application. Check the label. Also see *Preplant Weed Control, Preplant – Site Preparation Prior to any Crop*, page 90 for details of products, rates and remarks.

#### Preplant (PP) Weed and Cover Crop Control

Control cover crops and emerged weeds before planting berry crops. Refer to Table 6-1. *Non-Selective Herbicides Available for Preplant Site Preparation*, page 87. Alternatively, a grower may choose to kill the cover crop and/or emerged weeds just before planting the berry crop and either till the area or leave the seedbed untilled.

#### Preplant Incorporated (PPI)

Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are

required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

### **Preemergence (PRE)**

Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall. These materials prevent emergence of many weed seedlings without reducing crop stand. Apply immediately after seeding or at least before the emergence of the crop. If these materials are applied after weeds have emerged, kill is usually poor. Best results are obtained with this method when conditions for weed seed germination are good.

### **Postemergence (POST)**

These chemicals are applied after the berry crop is planted. Applied as directed, the weeds can be killed without injury to the crop. Leaf stage of the weeds is critical for good control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

### **Inter-Row Weeding**

The herbicide is directed between the berry crop rows onto the emerged weeds. The herbicide is used as a rescue operation where other methods of weed control have failed. Use special low pressure (7–15 kPa) applicators such as dribble bars or vibra jets equipped with shields to prevent wetting the crop. See *Stale Seedbed and Inter-Row Weeding*, page 92.

### **Wiper Applicators for Selective Weed Control**

Wiper applicators (rope-wick, roller applicator or similar device) have been extensively used with glyphosate (ROUNDUP). Check product labels for use of this application technique with other herbicides.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
<b>BLUEBERRIES, HIGHBUSH</b>			

**Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.**

**CULTURAL WEED CONTROL – see Cultural Weed Control in Berry Crops, page 284.**

**Mulching:** Biodegradable mulch could be used for weed control within the plant row. Sawdust mulch will assist in weed control if it is applied early in the season before the weed seeds germinate. Apply sawdust 5 cm thick. The mulch will not prevent the germination of weed seeds that may blow onto the surface of the mulch.

In subsequent years, the organic matter in the mulch may tie up and thus reduce the effectiveness of certain residual herbicides.

The nitrogen requirements of the crop will change as the mulch is degraded. Initially nitrogen will be consumed by micro-organisms, thus necessitating higher rates of nitrogen fertilizer. Later, as the sawdust is degrading, nitrogen will be released and the crop may require less nitrogen fertilizer than an unmulched crop. It may take 2 years or more for sawdust mulch to significantly decompose. Adjust fertilizer rates according to mulch breakdown, plant growth and leaf nutrient analysis results.

**Recommended rates per hectare or per acre refer to area actually treated with herbicide.**

**CAUTION – SIMAZINE, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of the planting.**

glufosinate ammonium	0.41–0.75 kg/ha		

## CRANBERRIES

Maintaining a healthy and vigorous crop will aid in weed control by avoiding openings in the bed for weed germination and establishment.

Prevent weeds from setting seed on dikes and in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from setting seed. Seeding the dikes with a desirable grass cover will reduce the opportunities for weed establishment and will provide bank stabilization.

**Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.**

### Soil Applied Grass and Broadleaf Herbicides

## STRAWBERRIES

**Cultural Weed Control – See notes on Cultural Weed Control in Berry Crops, page 284.**

Use straw mulch that is free of weed seeds to avoid importing weeds into the field. The mulch should be spread between the rows when it is pulled off the plants in the spring to provide additional weed control.

**Recommended rates per hectare or per acre refer to area actually treated with herbicide.**

**CAUTION:** DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of a planting.

**Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.**

### Soil Applied Grass and Broadleaf Herbicides

CHATEAU WDG (51.1%)	0.21 kg/ha	0.08 kg/ac	<ul style="list-style-type: none"> <li>• Apply <b>ONCE</b> per season as a broadcast spray to dormant plants or as a row middle spray using a shielded sprayer to non-dormant plants.</li> <li>• Broadcast applications may be made to dormant strawberries.</li> <li>• Apply prior to weed emergence.</li> <li>• Apply to coarse and medium textured soils with less than 5% organic matter.</li> <li>• Apply using ground application <b>ONLY</b>.</li> <li>• <b>Do NOT</b> apply after fruit set.</li> <li>• <b>Do NOT</b> allow spray drift to come in contact with fruit or foliage.</li> <li>• <b>Do NOT</b> apply through irrigation equipment. After use, tanks and nozzles must be cleaned with a 3% ammonia solution. Please review label for more detailed instructions.</li> </ul>
flumioxazin	0.11 kg/ha		<ul style="list-style-type: none"> <li>• <b>Planting year, 2–4 weeks after planting.</b></li> <li>• <b>Planting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Harvesting year, spring immediately after mulch removal.</b></li> <li>• PRE – Before weed emergence.</li> <li>• Apply the higher rate to transplants.</li> <li>• Shallow cultivation to incorporate herbicide into the soil surface may improve weed control.</li> <li>• <b>Do NOT</b> use on muck soils.</li> </ul>
DACTHAL W-75 (75 WP)	9–13.5 kg/ha	3.6–5.4 kg/ac	<ul style="list-style-type: none"> <li>• <b>Planting year, 2–4 weeks after planting.</b></li> <li>• <b>Planting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Harvesting year, spring after mulch removal.</b></li> <li>• <b>Harvesting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Harvesting year, late fall.</b></li> <li>• PRE – Apply once per season before weeds emerge or following cultivation.</li> <li>• Incorporation by rainfall, irrigation or cultivation is essential.</li> <li>• Where daughter plant establishment is important, (e.g. for plant producers) delay application until the desired number of daughter plants have been established.</li> <li>• Inhibition of daughter plant roots can occur where soil moisture is low and will be minimized if irrigation is applied shortly after application.</li> </ul>
DEVRINOL DF (50 DF)	9 kg/ha	3.6 kg/ac	<ul style="list-style-type: none"> <li>• <b>Planting year, 2–4 weeks after planting.</b></li> <li>• <b>Planting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Planting year, late fall.</b></li> <li>• <b>Harvesting year, spring after mulch removal.</b></li> <li>• <b>Harvesting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Harvesting year, late fall.</b></li> <li>• PRE – Apply once per season before weeds emerge or following cultivation.</li> <li>• Incorporation by rainfall, irrigation or cultivation is essential.</li> <li>• Where daughter plant establishment is important, (e.g. for plant producers) delay application until the desired number of daughter plants have been established.</li> <li>• Inhibition of daughter plant roots can occur where soil moisture is low and will be minimized if irrigation is applied shortly after application.</li> </ul>
napropamide	4.5 kg/ha		<ul style="list-style-type: none"> <li>• <b>Planting year, 2–4 weeks after planting.</b></li> <li>• <b>Planting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Planting year, late fall.</b></li> <li>• <b>Harvesting year, spring after mulch removal.</b></li> <li>• <b>Harvesting year, late summer/fall (around Labour Day).</b></li> <li>• <b>Harvesting year, late fall.</b></li> <li>• PRE – Apply once per season before weeds emerge or following cultivation.</li> <li>• Incorporation by rainfall, irrigation or cultivation is essential.</li> <li>• Where daughter plant establishment is important, (e.g. for plant producers) delay application until the desired number of daughter plants have been established.</li> <li>• Inhibition of daughter plant roots can occur where soil moisture is low and will be minimized if irrigation is applied shortly after application.</li> </ul>

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. Not all formulations are registered on all crops. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
DUAL II MAGNUM (915 g/L)  s-metolachlor/benoxacor	1.25–1.75 L/ha  1.14–1.6 kg/ha	0.5–0.7 L/ac	<ul style="list-style-type: none"> <li>• Planting year, before planting.</li> <li>• PPI or PRE – Apply and incorporate, or apply post-transplanting before weeds emerge.</li> <li>• Apply <b>ONLY</b> once per year.</li> <li>• Apply by ground application equipment <b>ONLY</b>.</li> <li>• <b>Do NOT</b> apply to cultivar Joliette.</li> <li>• <b>Do NOT</b> harvest berries from varieties bearing fruit in year of planting.</li> <li>• Incorporation is required for nutsedge control. Nutsedge control may be limited during extended periods of dry hot weather following application.</li> <li>• Use the higher application rate for heavier weed problems.</li> </ul>
GOAL 2XL (240 g/L)  oxyfluorfen	1.0 L/ha  0.24 kg/ha	0.4 L/ac	<ul style="list-style-type: none"> <li>• Planting year, late fall.</li> <li>• Harvesting year, late fall.</li> <li>• PRE – Before weed emergence.</li> <li>• Apply in 500 L spray solution/ha.</li> <li>• Apply <b>ONLY</b> once per year as a ground application.</li> <li>• Apply to dormant plants before applying mulch in late fall.</li> <li>• For control of labeled weeds plus field pansy and wood sorrel (oxalis).</li> <li>• <b>Do NOT</b> apply within 150 days of harvest.</li> </ul>
SINBAR (80 WP) or SINBAR (80 WDG)  terbacil	0.7–0.85 kg/ha  0.56–0.68 kg/ha	0.28–0.34 kg/ac	<ul style="list-style-type: none"> <li>• Planting year, late fall.</li> <li>• Harvesting year, renovation.</li> <li>• Harvesting year, late fall.</li> <li>• PRE – Apply to a weed-free soil surface just before mulching.</li> <li>• Apply in at least 300 L/ha water (120 L/ac).</li> <li>• Use low rate where it is planned to use SINBAR again in the spring.</li> <li>• Use lower rate on sandy soils low in organic matter.</li> <li>• Use lower rate on sensitive varieties such as Annapolis, Bounty, Cavendish, Glosscap, Kent, Micmac, Mira and Wendy since they may be severely injured.</li> <li>• <b>Do NOT</b> apply to weak or diseased plants of any variety.</li> <li>• <b>Do NOT</b> overlap spray swaths.</li> </ul>

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. Not all formulations are registered on all crops. See label for specific uses and rates.

TRADE NAME (Concentration) <i>active ingredient</i>	PRODUCT RATE PER HECTARE <i>active rate per ha</i>	PRODUCT RATE PER ACRE	PRECAUTIONS
SINBAR (80 WP) <i>or</i> SINBAR (80 WDG)	0.28–0.55 kg/ha	0.11–0.22 kg/ac	<ul style="list-style-type: none"> <li>Planting year, 4–6 weeks after planting.</li> <li>Planting year, late summer/fall (around Labour Day).</li> <li>Harvesting year, spring after mulch removal.</li> <li>Harvesting year, late summer/fall (around Labour Day).</li> <li>PRE – Apply before weeds emerge or to very small weeds.</li> <li>Apply when mother plants are well established but before runnering becomes extensive and new runner plants are rooting.</li> <li>Apply in at least 300 L/ha water (120 L/ac).</li> <li>Use lower rate on sandy soils low in organic matter.</li> <li>Use lower rate on sensitive varieties such as Kent, Bounty, Micmac, Annapolis, Gloscap and Cavendish since they may be severely injured at higher rates.</li> <li><b>Do NOT</b> apply to weak or diseased plants of any variety.</li> <li><b>Do NOT</b> overlap spray swaths.</li> <li>Shallow cultivation can be done to train runners and control escaped weeds without destroying the effectiveness of the herbicide.</li> </ul>

Use higher water volumes on dense vegetation.</li> <li>• Perennial weeds will only be suppressed.</li> <li>• Only emerged weeds will be controlled.</li> </ul>
paraquat	1.1 kg/ha		

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. Not all formulations are registered on all crops. See label for specific uses and rates.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 15. TREE FRUIT & GRAPES

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and give general comparisons based on use as described in this guide. Under unfavorable conditions (e.g. too dry, too wet, too cold, or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

## Cultural Weed Control in Fruit Crops

A successful weed control program must integrate cultural and chemical weed control practices. Growers cannot depend entirely on chemical weed control in fruit and vine crops, since there is a limited spectrum of herbicides registered for these crops.

### Perennial Weed Control

It is important to identify and control perennial weeds in the preplanting year. It is very difficult to control perennial weeds once a planting is established because of crop sensitivity to some herbicides and since it is not possible to clean cultivate in established orchards or vineyards.

The following perennial weeds present serious problems in these crops; quackgrass, bindweed, vetch, wild grape, perennial nightshade, thistles, ground-ivy (creeping charlie) and burdock.

Systemic herbicides such as glyphosate (e.g. ROUNDUP) or amitrole (e.g. AMITROL 240) should be applied to perennial weeds in the preplanting year. Consult the product label and be sure to use the recommended rate for the weed in question. Apply the herbicide at the proper stage of growth of the weed, otherwise only temporary control will be achieved. Repeated cultivations of some perennial weeds such as bindweed will also provide control.

### Site Preparation

A green manure crop such as perennial rye-grass or Sudan grass should be established in the preplanting year following or in conjunction with measures to control perennial weeds. This crop will provide competition to reduce weed growth as well as improving the soil structure. Non-selective herbicides can be applied before planting the green manure crop

and before plowing it under. Short residual selective herbicides such as 2,4-D may be used with the green manure crop, but avoid using herbicides that leave a soil residue that will carry over into the planting year. See Chapter 6, *Preplant – Site Preparation Prior to any Crop*, page 90.

### Mulching

A biodegradable plastic mulch could be used for weed control in the planting strip. Mulch will also assist in weed control beneath the trees or in the planting strip if it is applied early in the season before the weed seeds germinate. Use mulch that is free of weed seeds and ensure that enough nitrogen is provided for the plants. The mulch should be pulled away from around the tree bases for winter rodent protection. Peastone gravel is another option that can be applied around the base of the trees. The gravel will provide weed control, as well as, improve drainage, encourage deeper rooting and discourage rodents.

### Reducing Weed Pressure

Cultivation can provide weed control between the rows. Alternatively, a vigorous sod between the rows will prevent weeds from becoming established. It is better to seed a fescue sod rather than rely on a natural sod composed of weed and grass species because the weeds will seed into the orchard or vine row.

Prevent weeds from setting seed in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from flowering. Try to control weeds that escape before they set seed by cultural removal or chemical mowing. In some situations, tools such as a weed whip may be of use. Mowers are available which will cut close to the trees without injury. Mowing, however, will not eliminate weed competition.

### Rotating Herbicide Families

(See Table 4-6. *Weed Populations Confirmed Resistant to Herbicide Groups in Ontario Counties*, page 74).

In perennial crops, rotation of herbicide families is important to minimize the build up of seed from weed escapes, including triazine tolerant weeds. Rotation will also help avoid an accumulation of herbicide residues in the soil that may result in crop injury over a period of years and may hinder replanting.

### Herbicide Application Timings

#### Preplant (PP) Treatments

Preplant treatments are applied before the orchard or vineyard is planted. Some of these herbicides kill seedlings soon after germination while others also kill weed seeds. Most herbicides used for these treatments must be thoroughly incorporated into the soil by cultivation soon after application. Check the label. Also see *Preplant Weed Control, Preplant – Site Preparation Prior to any Crop*, page 90 for details of products, rates and remarks.

#### Preplant (PP) Weed and Cover Crop Control

Control cover crops and emerged weeds before planting orchards or vineyards. Refer to Table 6-1. *Non-Selective Herbicides Available for Preplant Site Preparation*, page 87. Alternatively, a grower may choose to kill the cover crop and/or emerged weeds just before planting the orchard or vine crop and either till the area or leave the seedbed untilled.

#### Preplant Incorporated (PPI)

Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward

machinery cleanliness and/or treating fields with perennial weeds last.

### Preemergence (PRE)

Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall. These materials prevent emergence of many weed seedlings without reducing crop stand. Apply immediately after seeding or at least before the emergence of the crop. If these materials are applied after weeds have emerged, kill is usually poor. Best results are obtained with this method when conditions for weed seed germination are good.

### Postemergence (POST)

These chemicals are applied after the orchard or vineyard is planted. Applied as directed, the weeds can be killed without injury to the crop. Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label for more details. Always use appropriate drift management technology.

### Inter-Row Weeding

The herbicide is directed between the orchard and/or vineyard rows onto the emerged weeds. The herbicide is used as a rescue operation where other methods of weed control have failed. Use special low pressure (7–15 kPa) applicators such as dribble bars or vibra jets equipped with shields to prevent wetting the crop. See *Stale Seedbed and Inter-Row Weeding*, page 92.

### Wiper Applicators for Selective Weed Control

Wiper applicators (rope-wick, roller applicator or similar device) have been extensively used with glyphosate (ROUNDUP). Check product labels for use of this application technique with other herbicides.

## APPLES

### Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.

**Recommended rates per hectare or per acre refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.**  
**CAUTION** – simazine, DEVRINOL and SINBAR residues high enough to harm many crops may persist for several years after removal of orchard.

## APPLES

## 15. TREE FRUIT & GRAPES

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
PRINCEP NINE-T (90 WG) + glyphosate (360 g/L)*	2.5–5 kg/ha 2.25–12 L/ha	1–2 kg/ac 0.9–4.8 L/ac	• Established plantings ONLY. • To control actively growing weeds, with residual control of germinating weeds.
or glyphosate (480 g/L)*	1.67–8.9 L/ha	0.67–3.56 L/ac	• Apply in 200–300 L/ha water (80–120 L/ac) as a directed spray.
or glyphosate (500 g/L)*	1.6–8.54 L/ha	0.64–3.41 L/ac	• Remove all suckers from base of trunks before application.
or glyphosate (540 g/L)*	1.48–7.9 L/ha	0.59–3.16 L/ac	• Do NOT apply to trees with green bark in the area of application.
simazine + glyphosate	2.25–4.5 kg/ha 0.8–4.27 kg/ha		

## APRICOTS

**Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.**

**Recommended rates per hectare or per acre refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.**

**CAUTION** – simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of orchard.

### Soil Applied Grass Herbicides

DUAL II MAGNUM (915 g/L)	1.75 L/ha	0.7 L/ac	• New and established plantings. • PRE – Apply once per year as a band treatment under the trees before weeds emerge.
s-metolachlor/benoxacor	1.6 kg/ha		• Avoid contact with trunk and leaves of trees. • Do NOT use on sandy soil with less than 2% organic matter.

### Soil Applied Broadleaf Herbicide

AIM EC (240 g/L)	36.5–150 mL/ha	14.8–60 mL/ac	• New and established plantings.
+ AGRAL 90	2.5 L/1,000 L	2.5 L/1,000 L	• Apply POST with a hooded sprayer between the rows.
or AG-SURF	2.5 L/1,000 L	2.5 L/1,000 L	• Apply to actively growing weeds up to 10 cm tall.
or MERGE	1 L/1,000 L	1 L/1,000 L	• Apply to basal shoots (suckers) before they have a hardened bark.
carfentrazone-ethyl	8.8–36 g/ha		• Use a higher rate of 150 mL/ha for control of suckers.
+ non-ionic surfactant	0.25% v/v		• Apply 200 L/ha (80 L/ac) water.
or surfactant/solvent	0.1% v/v		• Do NOT apply closer than 30 days to harvest.
			• Do NOT exceed more than two applications per year.
			• Severe injury may result if the spray is allowed to come in contact with the green bark, leaves, bloom or fruit.

### Soil Applied Grass and Broadleaf Herbicides

ALION 200 SC (200 g/L)	0.375 L/ha	0.152 L/ac	• Established plantings ONLY.
indaziflam	0.075 kg/ha		• PRE to weeds. Apply to soil before weeds germinate. If weeds have emerged, this product may be tank-mixed with a burndown herbicide (consult label for further instructions).

• May be applied at anytime throughout the growing season when the ground is not frozen or snow covered.

• Excessive crop or weed debris present on the soil surface at time of application may prevent uniform product distribution reaching the soil and reduced weed control.

• Apply ONLY once per growing season.

• Apply ONLY to crops that have been established for at least three full growing seasons.

\* See Table 4-1. *Herbicides Used In Ontario*, page 29, for formulations available. Not all formulations are registered on all crops. See label for specific uses and rates.

## CHERRIES AND PLUMS

Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.

Recommended rates per hectare **or** per acre refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.

**CAUTION** – Simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of orchard.

## GRAPES

**Site Preparation Before Planting – See Chapter 6, *Preplant Weed Control*, page 90.**

**Cultural Weed Control – See *Cultural Weed Control In Fruit Crops*, page 304.**

Hilling the vines at regular intervals throughout the year will aid in weed control. Be aware that this disruption of the soil will also disturb any residual herbicides.

The use of cultivation, mulch or rye cover crops between the rows will provide better water penetration as well as aid in weed control.

Cultivation after planting is needed to level the soil, and early establishment on trellises or stakes will minimize damage from cultivation. Hilling for winter protection can be started in late summer, and will control late germinating weeds. Removing of hills each spring will also aid in weed control.

**Rates per hectare or per acre refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.**

**CAUTION** – simazine, KARMEX, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of vineyard.

### Soil Applied Grass Herbicides

FRONTIER MAX (720 g/L)	0.96 L/ha	0.38 L/ac	<ul style="list-style-type: none"> <li>• Non-bearing grapevines ONLY.</li> <li>• Do NOT harvest within 2 years of application on first year grapes.</li> <li>• Do NOT harvest within 1 year of application on 2nd year grapes.</li> <li>• PRE – Rainfall is required within 10 days of application to achieve sufficient herbicide activation.</li> <li>• Single application directed under the vines.</li> <li>• Do NOT apply by air.</li> <li>• Apply to weed-free soil, after planting or dehilling.</li> </ul>
dimethenamid	0.69 kg/ha		

### Soil Applied Grass and Broadleaf Herbicides

CASORON G-4 (4 GR)	110–225 kg/ha	44–90 kg/ac	<ul style="list-style-type: none"> <li>• Established plantings ONLY.</li> <li>• PRE – Apply to cool moist but unfrozen soil in late fall or spring before weeds emerge.</li> <li>• Do NOT apply if air temperatures are above 10–15°C to avoid injury from volatilization.</li> <li>• Apply to dormant healthy vines only.</li> <li>• Do NOT apply to vines until they have been established for at least 2 full years.</li> <li>• For annual weeds, use 110–175 kg/ha (44–70 kg/ac).</li> <li>• For quackgrass, and broadleaf perennial weeds, use 175–225 kg/ha (70–90 kg/ac).</li> <li>• Use the higher rate of 225 kg/ha only every other year.</li> </ul>
dichlobenil	4.4–9 kg/ha

## PEARS

**Site Preparation Before Planting – See Chapter 6, Preplant Weed Control, page 90.**

**Recommended rates per hectare or per acre refer to area actually treated with herbicide. Unless specified, apply all treatments in 150–300 L/ha (60–120 L/ac) water.**

**CAUTION – simazine, DEVRINOL and SINBAR residues, high enough to harm many crops, may persist for several years after removal of orchard.**

### Soil Applied Grass and Broadleaf Herbicides

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

**Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.**

# 16. NURSERY & ORNAMENTAL CROPS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g. too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

**BOLD** numbers indicate the weed is listed on the product label for control or suppression.

- Insufficient information available to make a rating.

<sup>1</sup> Use higher rates for weeds larger than 15 cm tall or across.

\* Various formulations available, see Table 4-1. *Herbicides Used in Ontario*, page 29.

To convert kg/ha or L/ha to g/100 m<sup>2</sup> or mL/100 m<sup>2</sup> – Multiply by 10 and change units.  
For example – 11 kg/ha becomes 110 g/100 m<sup>2</sup>  
28.4 L/ha becomes 284 mL/100 m<sup>2</sup>

**Preplant Incorporated (PPI)** – Two incorporations at right angles operating at a depth of 10 cm using a double disk (7–10 km/hr) or vibrating shank S-tine cultivator (10–13 km/hr) are required unless otherwise stated. Cultivation-type equipment used for herbicide incorporation is known to spread perennial weeds to previously uninfested areas. Special attention should be directed toward machinery cleanliness, and/or treating fields with perennial weeds last.

**Preemergence (PRE)** – Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. Shallow cultivation, rotary hoeing or harrowing will control weed escapes and improve herbicide activity in the absence of rainfall.

**Postemergence** – Leaf stage of the weeds is critical for good weed control. Smaller weeds are generally easier to kill but there needs to be enough leaf surface to intercept the herbicide. Apply according to recommended leaf stages. Crop stage is important to optimize crop safety. Adjuvants will frequently improve the weed control when used as directed. Weather or other conditions may influence the optimum rate of adjuvant, see the product label

for more details. Always use appropriate drift management technology.

**Warning** – Refer to manufacturer's instructions for waiting period required after planting.

**Warning** – Certain species may be injured by the following herbicides. Check manufacturer's directions for labeled species before use.

For more information, see Chapter 4, *Herbicides Used in Ontario*, page 27  
and Chapter 5, *Notes on Adjuvants*, page 77.

## HERBACEOUS ORNAMENTALS

Site Preparation Before Planting – See *Preplant Weed Control*, page 90.

### Herbaceous Ornamentals – Soil Applied Grass and Broadleaf Herbicides

DACTHAL W-75 (75 WP)	17 kg/ha	6.8 kg/ac	<ul style="list-style-type: none"><li>• Apply at lining out, late fall or early spring in 340 L of water.</li><li>• Applications should be made to soil recently cultivated to a uniform texture.</li><li>• Rain or irrigation (1 cm) is needed to activate this herbicide.</li><li>• <b>Do NOT</b> use on Germander, Telanthera, Ajuga, Mesembryanthemum, Dianthus, Viola Phlox and Vinca minor.</li></ul>
chlorthal dimethyl	12.75 kg/ha		
DUAL II MAGNUM (915 g/L)	1.25–1.75 L/ha	0.5–0.7 L/ac	<ul style="list-style-type: none"><li>• <b>Apply PRE or early POST.</b></li><li>• Apply <b>ONLY</b> once per year.</li><li>• Apply in a minimum of 150–200 L/ha of water.</li><li>• Apply by ground application equipment <b>ONLY</b>.</li><li>• To avoid plant injury, <b>Do NOT</b> apply DUAL II MAGNUM to seedbeds, cutting beds, or uprooted cuttings before transplanting or to plants until the soil is settled around their roots.</li><li>• After applying onto foliage, irrigate plant to wash off DUAL II MAGNUM and reduce plant injury.</li><li>• <b>Do NOT</b> apply to crop that will bear harvestable fruit within 1 year to avoid residues.</li><li>• <b>Do NOT</b> apply in residential areas.</li></ul>
s-metolachlor/benoxacor	1.14–1.6 kg/ha		
TREFLAN EC(480 g/L) <b>or</b> RIVAL EC (500 g/L) <b>or</b> BONANZA 480 (480 g/L)	1.2–2.4 L/ha 1.2–2.3 L/ha 1.25–2.3 L/ha	0.5–0.96 L/ac 0.48–0.92 L/ac 0.5–0.92 L/ac	<ul style="list-style-type: none"><li>• PPI – Must be incorporated before transplanting.</li><li>• <b>Do NOT</b> use for seeded annuals.</li><li>• Check the label for list of tolerant species.</li><li>• Check the label for application rate as it varies with soil type.</li><li>• May be incorporated 3 weeks prior to planting up until planting.</li></ul>
trifluralin	0.6–1.155 kg/ha		

### Herbaceous Ornamentals – Postemergent Grass Herbicides

VENTURE L (125 g/L)	0.6–2 L/ha	0.24–0.8 L/ac	<ul style="list-style-type: none"><li>• For <b>Campanula</b> and <b>Sedum</b> – direct spray <b>ONLY</b> to avoid contact with crop.</li><li>• Apply POST to actively growing grasses before tillering.</li><li>• Apply at 0.6 L/ha (0.24 L/ac) at 2–5 leaf stage of volunteer corn.</li><li>• Apply at 0.8 L/ha (0.32 L/ac) at 2–5 leaf stage of volunteer wheat and barley.</li><li>• Apply at 1 L/ha (0.4 L/ac) at 2–5 leaf stage of annual grasses (2–4 leaf for foxtails).</li><li>• Apply at 2 L/ha (0.8 L/ac) at 3–5 leaf stage of quackgrass and wirestem muhly.</li><li>• Thorough preplant tillage, fragmenting quackgrass rhizomes improves control.</li><li>• Many species are tolerant in field production only. Consult the label for list of tolerant species.</li></ul>
fluazifop-p-butyl	0.075–0.25 kg/ha		

\* See Table 4-1, *Herbicides Used in Ontario*, page 29, for formulations available. See label for specific uses and rates.

<b>Established Shelterbelts and Windbreaks – Postemergent Grass and Broadleaf Herbicides</b>			

glyphosate (360 g/L)	0.75–12 L/ha	0.3–4.8 L/ac	• For actively growing weeds in the fall, or spring prior to emergence of any crop.
or glyphosate (450 g/L)	0.6–9.6 L/ha	0.24–3.84 L/ac	• Allow 5–7 days translocation time after application before doing any tillage when conditions are good. If cool temperatures follow application, allow additional time for translocation to be completed before disturbing treated weeds.
or glyphosate (480 g/L)*	0.56–9 L/ha	0.22–3.6 L/ac	• Only weeds emerged at application time will be controlled. Additional weed control programs will be necessary to control weeds germinating later.
or glyphosate (500 g/L)*	0.54–8.64 L/ha	0.22–3.5 L/ac	• Repeat application to regrowth may be necessary for complete control.
or glyphosate (540 g/L)*	0.67–8 L/ha	0.27–3.2 L/ac	• For specific information on product rates and notes for annual and perennial weed control refer to Table 6-4. Postharvest Weed Control Ratings, page 93.
glyphosate	0.27–4.32 kg/ha		

## SHELTERBELTS (WINDBREAKS) TRANSPLANTED

Site Preparation Before Planting – See Chapter 6. *Preplant Weed Control*, page 90.

### Transplanted Shelterbelts and Windbreaks – Soil Applied Grass and Broadleaf Herbicides

TREFLAN EC(480 g/L)	1.25–2.4 L/ha	0.5–0.96 L/ac	• PPI – Apply after cultivation, and incorporate after application.
or RIVAL EC (500 g/L)	1.2–2.3 L/ha	0.48–0.92 L/ac	• Transplant the trees or shrubs so that most of their root system is placed below the treated layer of soil.
or BONANZA 480 (480 g/L)	1.25–2.3 L/ha	0.5–0.92 L/ac	• Apply higher rates to clay soils.
trifluralin	0.6–1.155 kg/ha		• Apply and incorporate from 3 weeks prior to planting up until planting.

### Transplanted Shelterbelts and Windbreaks – Postemergent Grass Herbicides

VENTURE L (125 g/L)	0.6–2 L/ha	0.24–0.8 L/ac	• Apply to actively growing grasses prior to tilling.
fluazifop-p-butyl	0.075–0.25 kg/ha		• Apply at 0.6 L/ha (0.24 L/ac) at 2–5 leaf stage of volunteer corn. • Apply at 0.8 L/ha (0.32 L/ac) at 2–5 leaf stage of volunteer wheat and barley. • Apply at 1 L/ha (0.4 L/ac) at 2–5 leaf stage of annual grasses (2–4 leaf for foxtails). • Apply at 2 L/ha (0.8 L/ac) at 3–5 leaf stage of quackgrass and wirestem muhly. • Thorough preplant tillage, fragmenting quackgrass rhizomes improves control. • <b>Do NOT</b> cultivate between rows until 5 days after application.

\* See Table 4-1. *Herbicides Used in Ontario*, page 29, for formulations available. See label for specific uses and rates.

TRADE NAME (Formulation) active ingredient	PRODUCT RATE PER HECTARE <i>active rate per ha</i>	PRODUCT RATE PER ACRE	PRECAUTIONS For more information, see Chapter 4, <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5, <i>Notes on Adjuvants</i> , page 77.
<b>WOODY NURSERY STOCK – FIELD GROWN NURSERY STOCK</b>			

**Cultural Weed Control – See Cultural Weed Control In Fruit Crops, page 304.**

Mechanical weed control such as cultivation and hand hoeing will provide weed control in sensitive species as well as provide control of weed escapes. Cultivators are available which will work in between trees and in the row.

**Site Preparation Before Planting – See Preplant Weed Control, page 90.**

**WARNING** – Refer to manufacturer's instructions for waiting period required after planting.

**WARNING** – Certain types of woody nursery stock may be injured by the following herbicides. Check manufacturer's directions for labeled species/cultivars before use.

**Woody Nursery Stock (Field Grown) – Soil Applied Grass Herbicides**

KERB (50 WP)	3 kg/ha	1.2 kg/ac	<ul style="list-style-type: none"> <li>• PRE – Apply in the late fall when the soil temperature is low but above freezing.</li> <li>• Soil moisture should be high.</li> <li>• This herbicide is absorbed through the roots.</li> </ul>
propyzamide	1.5 kg/ha		
DUAL II MAGNUM (915 g/L)	1.25–1.75 L/ha	0.5–0.7 L/ac	<ul style="list-style-type: none"> <li>• PRE – Apply in at least 150–200 L/ha of water.</li> <li>• Apply to soil prior to bud break of nursery stock.</li> <li>• <b>Do NOT</b> apply within 4 weeks of bud burst or until the needles have hardened.</li> <li>• For use on poplar stoolbeds, white spruce, Norway spruce, black spruce, white pine, Jack pine and red pine seedlings in their second year or older.</li> <li>• May have postemergent properties if applied to weeds before they reach the 2 leaf stage.</li> </ul>
s-metolachlor/benoxacor	1.14–1.6 kg/ha		

**Woody Nursery Stock (Field Grown) – Soil Applied Broadleaf Herbicides**

SUREGUARD (51.1%)	280–420 g/ha	112–168 g/ac	<ul style="list-style-type: none"> <li>• For control in field-grown ornamental deciduous and coniferous trees, including Christmas trees and trees produced for reforestation.</li> <li>• Tolerant species include: <i>Abies balsamea</i>, <i>Abies fraseri</i>, <i>Acer ginnala</i>, <i>Fraxinus pennsylvanica</i>, <i>Picea pungens</i>, <i>Pseudotsuga menziesii</i>, <i>Syringa reticulata</i> and <i>Thuja occidentalis</i>.</li> <li>• For postemergence, apply the higher rate. Consult the product label.</li> <li>• <b>Do NOT</b> apply to fine-textured soils.</li> <li>• Application should be made to tilled, weed-free deciduous tree plantings.</li> <li>• <b>ONLY</b> apply to healthy established trees.</li> <li>• <b>Do NOT</b> incorporate into soil after application.</li> <li>• <b>Do NOT</b> apply to moist or wet plant foliage.</li> <li>• <b>Do NOT</b> make more than two applications in a growing season.</li> <li>• May be used to maintain bare-ground non-crop areas in and around ornamental nurseries and field-grown ornamentals.</li> <li>• Apply using ground equipment.</li> <li>• Wait a minimum of 8 weeks before reapplying.</li> </ul>

--	---	--------------------------	--

## WOODY NURSERY STOCK – CONTAINER BEDS

**CULTURAL WEED CONTROL** – A successful weed control program must integrate cultural and chemical weed control practices.

Prepare the container bed area with a gravel layer and/or ground covers such as black plastic or opaque woven material. It is important that these surface covers exclude light in order to be effective in preventing weed seed germination. These ground covers can be used for a number of years before being replaced.

Keep the container beds and roadways free of weeds by physical removal or chemical mowing. Prevent weeds from setting seed in adjacent uncropped areas by using cultural or chemical weed control measures. Mowing at regular intervals will prevent many weeds from flowering. Try to control weed escapes before they set seed by cultural removal or chemical mowing. In some situations, such as along fences, tools such as a weed whip may be useful. Look for the source of weeds that disseminate into container areas such as poplars, willows, willowherb and Canada fleabane.

Control weeds around irrigation ponds so that small seeded weeds are not being sown into container stock with each watering. A vigorous grassed bank will help reduce weed infestations as well as providing bank stabilization. A filtering system in the irrigation line will remove weed seeds.

Removal of existing weeds from container stock before they flower **must be a priority job**. Once a weed flowers it can disseminate hundreds of seeds by wind or by catapulting seeds. Many container weed species have several generations per year because their seeds do not need to overwinter before germinating. Remove and discard all pulled weeds well away from the growing area so that seeds are not disseminated into nearby containers.

Since many species of container weeds overwinter in the protected environment of a polyhouse, it is important to thoroughly weed container stock in the fall. Be sure to remove the rosettes of winter annuals such as shepherd's-purse and Canada fleabane and established plants and seedlings of common and mouse-eared chickweed. If not removed, these plants will be flowering by May or earlier.

**WARNING** – Refer to manufacturer's instructions for waiting period required after planting.

**WARNING** – Certain types of woody nursery stock may be injured by the following herbicides. Check manufacturer's directions for labeled species/cultivars before use.

### Container Bed Preparation – Soil Applied Grass and Broadleaf Herbicides

CASORON 4G (4 Gr)	110–175 kg/ha	44–70 kg/ac	<ul style="list-style-type: none"> <li>• PRE – Apply to bare soil before putting container pots on beds.</li> <li>• Apply in spring when temperatures are cool and incorporate immediately with irrigation or mechanical incorporation.</li> <li>• For the best results, apply to soil with more than 2% organic matter content.</li> <li>• Use on gravel or sandy soils may result in inconsistent weed control.</li> <li>• <b>Do NOT</b> cover polyhouses with plastic within 1 month after application.</li> <li>• <b>Do NOT</b> apply within plastic covered polyhouses or within greenhouse structures.</li> <li>• Refer to label for tolerant species.</li> <li>• <b>Do NOT</b> transplant into treated soil for 1 year.</li> </ul>

## 17. TURFGRASS

**NOTES:** Weed control ratings are given as 0–9 where 0 indicates no control, and 9 indicates 90–100% control under ideal conditions. Ratings are subjective values based on best available information and given general comparisons based on use as described in this guide. Crop tolerance ratings are: E – Excellent, G – Good, F – Fair, P – Poor. Under unfavourable conditions (e.g. too dry, too wet, too cold or poor application) the herbicides may not be as effective as indicated. Ratings may vary with weed and crop stage and with the timing and rates of the product(s) being used. Ratings in **BOLD** indicate the weed is listed on the product label for control or suppression. Please see product label for more information on registered weed species, product uses and precautions.

Ontario's cosmetic pesticides ban took effect April 22, 2009. The requirements of the ban are detailed in Ontario Regulation 63/09 under the *Pesticides Act*. The ban prohibits the sale and use of pesticides for cosmetic purposes such as on lawns, gardens, parks and school yards. There are exceptions to the ban on the use of (Class 9) prohibited pesticides for agriculture and also for golf courses, specialty turf, and specified sports fields, if certain conditions are met.

The following pesticide recommendations include products that contain Class 9 pesticides which can only be used under an exception to the ban. These recommendations also include products that contain Class 11 pesticides (biopesticides) and certain lower risk pesticides which are allowed for cosmetic purposes to manage weeds in turfgrass.

To convert kg/ha or L/ha to g/100 m<sup>2</sup> or mL/100 m<sup>2</sup> – Multiply by 10 and change units.  
For example – 11 kg/ha becomes 110 g/100 m<sup>2</sup>  
28.4 L/ha becomes 284 mL/100 m<sup>2</sup>

## Managing Weeds in Turfgrass

The major species of broadleaf weeds infesting turf in Ontario are dandelion, plantain, black medick, chickweed, prostrate knotweed, mallow, henbit, ground-ivy, and white clover. The major grassy weeds are crabgrass, annual bluegrass, quackgrass, orchard grass and bentgrass.

### Cultural Practices to Manage Weeds in Turfgrass

The easiest, cheapest and most effortless way to keep turf fields free of weeds is to encourage vigorous growth of turfgrass. Most weeds cannot compete in a dense, healthy turf. Growth practices that encourage vigorous grass growth discourage weed infestations.

Such practices include mowing, fertilizing, watering and drainage, controlling thatch, avoiding compaction, selecting the appropriate turfgrass and removing weeds mechanically.

**Mowing** stimulates bud development and tillering, inducing the sod to become thick and dense. Cut commonly grown grasses such as the fescues, bluegrasses and turf-type perennial ryegrasses to a height of 4–6 cm. Invasion by weeds may occur if grasses are cut shorter than 4 cm.

Avoid scalping the turf when cutting around trees and flowerbeds. Do not remove more than one-third of the leaf area when mowing. Mowing too frequently may reduce the carbohydrate reserves of the turf, thereby reducing its competitiveness. Mowing can also be used to remove annual weeds and eliminate seed production, reducing or preventing the spread of weeds.

**Fertilizer** is particularly important in establishing a thick, dense and healthy turf stand. Regular, timely fertilizer applications can help turf out-compete broadleaf and grassy weeds. Too few nutrients applied to the turf leads to increased susceptibility to weed infestation and some disease. Too much fertilizer may lead to soft, weak grass that is also prone to disease and will not stand up to traffic.

**Watering** is critically important when normal rainfall does not provide enough moisture. Irrigate weekly, using 2.0–2.5 cm of water per application to help produce thick, deep-rooted turf.

Frequent light irrigation will have the opposite effect on the grass roots. It encourages the germination and growth of shallow rooted species such as crabgrass and creeping bentgrass. Too much irrigation water will lead to infestation by yellow nutsedge and annual

bluegrass. Provide adequate watering near trees and hedges because they compete for available moisture.

**Drainage** is important to ensure roots are healthy and functioning. Waterlogged soils do not provide roots with the air they need to function properly. Install adequate drainage if needed.

**Compaction** should be avoided to prevent invasion by weeds that thrive in compacted soil. Knotweed and annual bluegrass often invade turfgrass where compaction, caused by excessive traffic is a problem. While aeration practices do help, the best answer is to modify the area to reduce traffic. Immediate resodding or reseeding of damaged areas discourages weed infestations.

Select **turfgrass species** to match the growing environment and the intended use. For example, fescues are tolerant to low-light intensity in shaded areas under trees and also tolerate low maintenance. Turf-type perennial ryegrass varieties are quick to establish in newly seeded areas and will crowd out germinating weeds. Kentucky bluegrass, although slow to establish, is very competitive once established.

**Mechanical removal** of weeds can be very effective if weed populations are not too high. Weeds can be removed by hand or pulling with a knife or V-shaped spudding tool. There are many new non-selective weed control tools on the market that use steam, hot water, super-heated water, propane flamers, etcetera. There is limited research on the level of control of these new non-selective weed control tools. It is recommended to try these tools in a small area to determine their effectiveness. Be aware of applicator safety.

## **Chemical Weed Control**

Chemical weed control is often the easiest, most effective and cheapest way to control annual and perennial weeds when populations are very high.

### **New Turf**

After seeding new turf, many annual weeds may emerge before the grass seedlings. If these young weeds are not controlled, they will shade and eventually crowd out much of the grass population. Mowing at a height of 6–8 cm will eliminate many such weeds. If they are extremely thick, 2,4-D at half the usual concentration (0.4–0.6 kg in 800 L water/ha) or mecoprop-P (0.4–0.6 kg in 400 L water/ha) can be used but not before the grass has been emerged for at least 4 weeks.

### **Established Turf**

Applications of 2,4-D are most effective in the spring or in September when the weeds are growing well. This treatment generally thins clover. Weeds not normally controlled by 2,4-D may be controlled by mecoprop, or dicamba, or with combinations of one of these with 2,4-D. Mecoprop and dicamba are also sold in commercial mixtures with 2,4-D. See Table 18-2, *Susceptibility of Woody Plants to Various Herbicides and Mixtures as Foliage Sprays*, page 378 the response of common weeds to various herbicides. Thorough wetting of the weed foliage is important.

**Do NOT** use mixtures containing dicamba close to shrubs, or other susceptible ornamentals at rates

above 0.425 kg/ha (active). Prepared mixtures of this chemical and 2,4-D are effective on a wide range of turf weed species, including knotweed, which is not controlled by most other herbicides except when very young.

### **Broadleaf Herbicides**

2,4-D controls many broadleaf weeds including dandelion, plantains, shepherd's purse, smartweeds and vetch.

Mecoprop controls many 2,4-D and MCPA tolerant weeds such as chickweeds, clovers, ground-ivy and black medick, and is generally safer to use on bentgrass than 2,4-D.

Dicamba controls broadleaf weeds including 2,4-D tolerant weeds such as chickweeds, clover and young knotweed but does not adequately control plantains.

MCPA controls dandelion, plantains and shepherd's purse. Weeds tolerant to MCPA include chickweeds, clovers and black medick. Two and three-way mixes of these herbicides extend the spectrum of weeds that are controlled compared to only one of these herbicides.

### **Grass Herbicides**

BETASAN, DIMENSION and corn gluten meal based products can be applied before crabgrass emerges in the spring, and ACCLAIM SUPER and DIMENSION can be applied after emergence. Corn gluten meal based products can also be applied in the fall.

## **Herbicide Application Timings**

### **Site Preparation or Preplant (PP) Treatments**

Preplant treatments are applied before the turf is sown or planted. Also see *Preplant Weed Control, Preplant – Site Preparation Prior to any Crop*, page 90 for details of products, rates and remarks.

### **Preemergence (PRE)**

Rainfall at 15–20 mm within 7–10 days after application is necessary to activate preemergence treatments. These materials prevent emergence of many weed seedlings without reducing turf stand. Apply immediately after seeding or at least before the emergence of the turf.

### **Postemergence (POST)**

Herbicides are applied after the turf seeds have sprouted. Applied as directed, the weeds can be killed without injury to the turf. It is important to apply herbicides to weeds at their most susceptible stage. Smaller weeds are generally easier to kill but enough leaf surface is needed to intercept the required amount of herbicide.

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

## 18. ROADSIDES & NON-CROP AREAS

### Roadsides, Rights-of-Way, Fencerows and Non-Crop Areas

#### Fencerows and Farm Areas

In agricultural areas, weeds growing in fencerows, around buildings and on roadsides are sources of potential weed infestation to other parts of a farm. In addition, brush and weeds around fields harbor insects, diseases and other pests that may be detrimental to farming operations. Shrubs like wild cherry may be possible sources of livestock poisoning. Farmers may also wish to reclaim land on which willows or brush have encroached.

Ontario's cosmetic pesticides ban came into effect April 22, 2009. The requirements of the ban are detailed in Ontario Regulation 63/09 under the *Pesticides Act*. Use of Class 9 pesticides for agricultural purposes is exempt from the cosmetic pesticides ban. Farmers are not exempt from the cosmetic pesticides ban when using pesticides for maintaining lawns and gardens around the farm house. Lawns and gardens are not considered part of an agricultural operation.

#### Roadsides, Rights-of-Way and Waste Places

Under exceptions to the cosmetic pesticides ban, Class 9 pesticides can be used in situations related to the promotion of public health or safety. Ontario Reg. 63/09 defines "the promotion of public safety or health" to include "the destruction, prevention, or control of plants, fungi or animals that affect public works or other buildings and structures." Public work is defined in the regulation, and means a structure that provides a benefit to the public and that is owned or operated by the Government of Ontario or Canada

or by any board or commission thereof, or by any municipal corporation, public utility commission or by private enterprise and includes:

- Any railway, canal, highway, bridge, power works including all property used for the generation, transformation, transmission, distribution or supply of hydraulic or electrical power, gas works, water works, public utility or other work.

Class 9 pesticides can be used in an extermination related to public works only for the following:

- To prevent structural damage to a public work, if the potential damage to the public work caused by the pest would place the health or safety of a person at risk.
- For essential maintenance of the public work, if the pest would interfere with or prevent the essential maintenance.
- To allow for emergency access to the public work.
- To ensure the security of the public work if the pest would place the security at risk (eg. vegetation-free security perimeters at power generating facilities).
- To prevent damage to the structural integrity of a building or other structure that is not part of a public work, if the potential damage caused to the building or structure by the pest could place the health or safety of a person at risk.

The use of pesticides for the above mentioned applications does not include the use of Class 9 pesticides along portions of highways that are accessed by pedestrians on a regular basis or other portions where the public is invited to stop, including a rest area or picnic area.

Commencing April 22, 2010, Class 9 pesticides used for extermination with respect to a public work must be applied by an appropriately licensed exterminator who is certified by the Integrated Pest Management Council of Canada (IPMCC) as a Public Works IPM Certified Applicator or licensed exterminator working under written instructions of a person who is a Public Works IPM Certified Applicator certified by the IPMCC body. The owner or operator of the public work is responsible for ensuring an annual report is prepared that summarizes all pesticides used.

Integrated Weed Management (IWM) on rights-of-way (ROW) and roadsides is based on the principles discussed in Section 1 Principles of Integrated Weed Management. IWM in public work situations involves managing weeds and brush by encouraging compatible vegetation by using a mixture of all tools available, such as competitive or allelopathic vegetation cover, mechanical and chemical weed control, biological weed control, and cultural methods. Compatible vegetation that competitively reduces weed and brush invasion is planted or allowed to develop naturally through selective and targeted herbicide applications (such as directed foliar, basal bark and cut-surface applications) or other weed control methods. Zonal management allows for reduced control measures on parts of a ROW based on the safety limitations. PRE and POST control monitoring of problem vegetation

and compatible vegetation goals permits the matching of treatments to the problem weeds or brush and the adjustment of programs to improve effectiveness. Effective programs incorporating targeted herbicide applications and both post-emergent and residual products extend the time periods between treatments based on individual ROW requirements.

Both railway and power supply authorities are concerned with maintaining safe and accessible rights-of-way by controlling growth of weeds and brush. In certain areas (beneath guide rails, in storage yards, under railway tracks and under fences at road intersections), it may be advantageous to completely kill all vegetation for long-term control. Consider vegetation control measures such as mechanical (e.g. cutting or mowing) and cultural practices (e.g. seeding desirable species) as an alternative to herbicides.

Precautions should always be taken to minimize herbicide drift in roadside and right-of-way vegetation management. It is advisable to inspect or monitor each roadside just prior to spraying to locate susceptible crops, water crossings, portions of highways that are accessed by pedestrians on a regular basis or other portions where the public is invited to stop, and other sensitive areas. Appropriate "shut off" and "turn on"

points should be marked so these areas can be avoided during the actual spray operation.

## Reduction of Herbicidal Drift

In the application of herbicides, especially of the hormone type (2,4-D, mecoprop, dichlorprop, dicamba, etc.) sensitive crops (grapes, tomatoes, turnips, tobacco, beans, carrots, beets, fruit trees, ornamental plants and many others) beyond the area being sprayed can be damaged by vapor or spray drift.

To reduce the danger of herbicidal drift:

1. Use only amine formulations when it is necessary to apply phenoxy herbicides (2,4-D, MECOPROP, dichlorprop, etc.) near sensitive, non-target plants.
2. Very slight spray drift with herbicides containing dicamba can be more damaging to soybeans and other crops than equivalent amounts of 2,4-D spray drift. There is also a possibility of dicamba vapor drift from treated plant foliage during high temperatures (in excess of 25°C); thus, use of dicamba containing herbicides should be avoided near sensitive, desirable plants.

3. Use the lowest pressure possible to apply the herbicide. This may mean the use of a dribble bar, Radiarc® boom, vibrajet nozzle, Directa-spra™ nozzle, flood jet or more conventional nozzle tips.
4. Manufacturer's recommendations regarding nozzle spacing and height should be carefully followed. It may be necessary to mount nozzles on skids to keep them at a constant distance from the surface to be sprayed.
5. For roadside spraying various spray additives are available which may reduce spray drift by increasing the viscosity or density of the spray. These materials should be used following manufacturer's directions and observing normal precautions (vehicle speed, wind velocity, proximity to sensitive crops, etc.).

**WARNING** – These methods and materials can reduce but not eliminate herbicidal drift. In areas near sensitive crops, all normal precautions must be taken. It should be emphasized that extremely low, even invisible, amounts of spray drift can be very damaging to sensitive crops.

## POISONOUS PLANT MANAGEMENT GIANT HOGWEED

Giant hogweed is a perennial weed, meaning the same plant will grow for more than two years. New plants are established only from seed. What is unique about giant hogweed is that it only flowers and produces seed once in its lifetime. Once it has produced seed, the plant dies. Therefore the strategy for limiting the spread and movement of giant hogweed is to stop seed production. This is easier said than done. The most appropriate time of year to remove plants is in late April or early May as plants are typically less than 30 cm in height, and are more susceptible to herbicide applications. Extreme heat and humidity are also avoided which make wearing appropriate protective clothing more comfortable.

To see a video on giant hogweed, scan this QR code with your smart phone or visit [ontario.ca/xo36](http://ontario.ca/xo36).

**FIGURE 18-1. Jet Injector Gun**

Injecting 10 mL of a 5% glyphosate solution with a jet injector gun.

### Spot Applications: Late April/Early May (ideal plant stage: 30 cm in height or less)

glyphosate (360 g/L)\*      2 L/100 L water

- Best applied as a spot application using a backpack sprayer.
- Apply to actively growing plants.
- Spray coverage should be uniform and complete.
- **Do NOT** spray to the point of runoff.
- Evaluate treated area 10–14 days after application to identify and treat any plants missed during the first application.

### Stem Injection (See Figure 18-1, on this page): Late May/Early June (plants that are between 1–2 m tall)

glyphosate (360 g/L)\*      10 mL of a 5% glyphosate solution/plant

- Best for small patches of giant hogweed that have gotten too large for spot applications with a backpack sprayer.
- Insert the injection gun at about chest height but below a node on the stem.
- Stem injections are best done with a jet injector gun which can be purchased at [www.jkinjectiontools.com](http://www.jkinjectiontools.com) (See Figure 18-1, on this page).

**Research Update:** In preliminary University of Guelph research trials, CLEARVIEW (aminopyralid/metsulfuron-methyl) has demonstrated acceptable control of giant hogweed. Further experimentation to verify these initial findings are ongoing.

\* See Table 4-1. *Herbicides Used in Ontario*, page 29 for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE <i>active rate per ha</i>	PRODUCT RATE PER ACRE	PRECAUTIONS For more information, see Chapter 4. <i>Herbicides Used in Ontario</i> , page 27 and Chapter 5. <i>Notes on Adjuvants</i> , page 77.
<b>PARSNIP, WILD</b>			

Wild parsnip is a biennial/perennial weed that reproduces by seed. The majority of seed germinates in the spring. Therefore, applications should be timed in the early part of spring to control seedlings and then again in the fall to control established first year rosette plants that were missed in the spring. Hand spudding that cuts off the root below ground is effective control for small patches.

#### April/May and Sept/Oct

glyphosate (360 g/L)*	2 L/ 100 L water	<ul style="list-style-type: none"> <li>• Best applied as a spot application using a backpack sprayer.</li> <li>• Apply to actively growing plants.</li> <li>• Spray coverage should be uniform and complete.</li> <li>• <b>Do NOT</b> spray to the point of runoff.</li> <li>• Evaluate treated area 10–14 days after application to identify and treat any plants missed during the first application.</li> </ul>
glyphosate	720 g/100 L water	

**Research Update:** In preliminary public research trials, MILESTONE (aminopyralid) and DISTINCT (diflufenzoxyr/dicamba) have demonstrated acceptable control of wild parsnip. Further experimentation to verify these initial findings are ongoing.

## POISON-IVY

Several herbicides have been shown to be effective for the control of poison-ivy. However, some growth may occur after treatment with any of these chemicals and re-treatment will be necessary to achieve eradication. The use of a herbicide treatment for poison-ivy must take into account the location in which the weed is growing. If desirable vegetation is close by exercise caution when applying herbicides so as to avoid off-target drift.

A 9–14 L sprayer is the most convenient method of applying herbicides to patches of poison-ivy. Thorough coverage of the leaves with the spray is essential for maximum effect. After spraying, leave the area alone until the plants die, at which time gather and bury the dead stems. Even at this stage poisoning may be brought about by handling the dead plant so protective clothing (e.g. rubber gloves, rain suit) is recommended. All treatments are most effective when poison-ivy is in full leaf and growing actively, from about June 15–July 31.

#### Postemergence to Poison-Ivy

AMITROL 240 (231 g/L)	9.25 L/ha	3.7 L/ac	<ul style="list-style-type: none"> <li>• Apply in at least 1,000 L/ha water (400 L/ac) when plants are actively growing. Thoroughly wet all foliage.</li> </ul>
amitrole	2.25 kg/ha		
ARSENAL (240 g/L)	3 L/ha	1.2 L/ac	<ul style="list-style-type: none"> <li>• Apply in sufficient water (100–550 L/ha (40–220 L/ac)) to wet all foliage during periods of active growth.</li> </ul>
imazapyr	0.72 kg/ha		
dichlorprop/2,4-D (610 g/L)* or dichlorprop/2,4-D (582 g/L)*	8 L/1,000 L water 11.7 L/1,000 L water		<ul style="list-style-type: none"> <li>• Best applied as a spot application using a backpack sprayer.</li> <li>• Apply spray until foliage is thoroughly wet.</li> </ul>
glyphosate (360 g/L)*	2 L/100 L water		<ul style="list-style-type: none"> <li>• Best applied as a spot application using a backpack sprayer.</li> <li>• Apply to actively growing plants.</li> <li>• Spray coverage should be uniform and complete.</li> <li>• <b>Do NOT</b> spray to the point of runoff.</li> </ul>
glyphosate	720 g/100 L water		

\* See Table 4-1. *Herbicides Used in Ontario*, page 29 for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
VANQUISH (480 g/L) <b>or</b> ORACLE (480 g/L) <b>or</b> VMD (480 g/L) + 2,4-D Amine (470 g/L)*	1.7 L/ha	0.68 L/ac	• Apply in at least 560 L/ha water (224 L/ac).
dicamba + 2,4-D	0.82 kg/ha 1.1 kg/ha	0.88 L/ac	

## INVASIVE PLANT MANAGEMENT

The impact of invasive species on crop land, native ecosystems, habitats and species is severe and often irreversible. The following section outlines best management practices based on herbicides that list the specific invasive species on their label as well as experience gained through public research trials conducted in Ontario.

### Bedstraw, Smooth – rangeland, permanent pasture and non-crop areas

GARLON XRT (755 g/L)	0.6–2.5 L/ha	0.24–1 L/ac	• Apply in 200–300 L/ha water (80–120 L/ac) when smooth bedstraw is actively growing. Increase rates as smooth bedstraw gets larger.
triclopyr	0.45–1.89 kg/ha		• Do NOT allow livestock to consume treated forage for 14 days following treatment. • Do NOT harvest treated forage for 14 days following treatment.

### Dog Strangling Vine – rangeland, permanent pasture and non-crop areas

ARSENAL (240 g/L)	3 L/ha	1.2 L/ac	• Apply in sufficient water (100–550 L/ha (40–220 L/ac)) to wet all foliage during periods of active growth (early May for dog strangling vine).
imazapyr	0.72 kg/ha		• Do NOT graze the treated area or cut for hay. • Do NOT apply in areas where tree roots may extend into the treated area. • This product can only be applied by licensed applicators.

**Research Update:** Dog strangling vine is a prolific seed producer, establishes dense stands throughout the growing season and produces multiple stems from the crowns of established plants. Effective control will require a systemic herbicide to control established plants, and if using a non-residual herbicide, a follow-up application will be needed to control new seedlings. Herbicide choice will be determined by current and planned uses for the site. Experimentation is underway to label additional products for dog strangling vine control.

### Garlic Mustard – forested areas

**Research Update:** A study conducted by Dr. Stephen Murphy (University of Waterloo) demonstrated that by planting bloodroot (*Sanguinaria canadensis*) at a density of 11 plant/m<sup>2</sup> or greater reduced populations of garlic mustard in wooded areas.

### Phragmites (Common Reed) – non-crop areas

ROUNDUP WEATHERMAX <b>or</b> VISION MAX (540 g/L)	1.34 L/100 L water	• Best applied as a spot application using a backpack sprayer. • Apply to actively growing plants in full bloom, typically in later summer or early fall. • Spray coverage should be uniform and complete.
glyphosate	720 g/100 L water	• Do NOT spray to the point of runoff. • Do NOT spray if there is standing water in the area where the phragmites exist. • A BMP document can be found at <a href="http://www.ontarioinvasiveplants.ca">www.ontarioinvasiveplants.ca</a> .

\* See Table 4-1. *Herbicides Used in Ontario*, page 29 for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
<b>For more information, see Chapter 4. Herbicides Used in Ontario, page 27 and Chapter 5. Notes on Adjuvants, page 77.</b>			

#### Purple Loosestrife – non-crop areas

glyphosate (360 g/L)*	2 L/ 100 L water	<ul style="list-style-type: none"> <li>• Best applied as a spot application using a backpack sprayer.</li> <li>• Apply to actively growing plants.</li> <li>• Spray coverage should be uniform and complete.</li> <li>• <b>Do NOT</b> spray to the point of runoff.</li> </ul>
glyphosate	720 g/100 L water	

**Bio-Control Options:** Galerucella beetles have provided effective biological control of purple loosestrife. The only known source of these beetles is through Ontario Beetles, P.O. Box 458, Paris, ON, N3L 3T5. Phone number: 519-442-3921.

#### Wild Chervil – rangeland, permanent pasture and non-crop areas

glyphosate (360 g/L)*	2 L/ 100 L water	<ul style="list-style-type: none"> <li>• Best applied as a spot application using a backpack sprayer.</li> <li>• Apply to actively growing plants.</li> <li>• Spray coverage should be uniform and complete.</li> <li>• <b>Do NOT</b> spray to the point of runoff.</li> </ul>
glyphosate	720 g/100 L water	

## RIGHTS-OF-WAY AND ROADSIDE VEGETATION MANAGEMENT

The main objectives of a weed control program for rights-of-way (ROW) and roadsides are: (1) to ensure ROW and highway access, safety and security; (2) to control weeds during establishment of seeded cover; (3) to control noxious and other weeds that may infest adjacent land by wind dispersal of seed; (4) to maintain a perennial, deep-rooted plant cover that will minimize erosion problems; (4) to control tall growing weeds so that mowing costs can be minimized; and (5) to prevent buildup of excessive vegetation that can become a fire hazard in the late summer or complicate snow removal in winter. Refer to Table 18-1. *Susceptibility of Various Weeds to Non-Crop Land Herbicides*, page 365 to identify weed species controlled by herbicides outlined in this section.

#### Postemergence Broadleaf Herbicides

2,4-D Amine 500 (470 g/L)* <b>or</b> 2,4-D Amine 600 (564 g/L)*	1.7–4.5 L/ha up to 3.9 L/ha	0.68–1.8 L/ac up to 1.56 L/ac	<ul style="list-style-type: none"> <li>• Apply in 100–300 L/ha water (40–120 L/ac) at the time of rapid weed growth (typically May, June and/or September).</li> <li>• Use the higher rate for larger weeds, dry or cold weather, or heavy infestations.</li> <li>• <b>Do NOT</b> apply more than two treatments per year.</li> </ul>
CLEARVIEW (52.5/9.45%)	135–230 g/ha	54–92 g/ac	<ul style="list-style-type: none"> <li>• Apply in a minimum of 110–200 L/ha water (44–80 L).</li> <li>• Product rates vary depending on the type of weed species targeted. Refer to Table 18-1. <i>Susceptibility of Various Weeds to Non-Crop Land Herbicides</i>, page 365 for the appropriate rate.</li> </ul>
aminopyralid/metsulfuron-methyl	83.6–142.5 g/ha		
dichlorprop/2,4-D (610 g/L)* <b>or</b> dichlorprop/2,4-D (582 g/L)*	2.75 L/ha 4 L/ha	1.1 L/ac 1.6 L/ac	<ul style="list-style-type: none"> <li>• Apply in 200–600 L/ha water (80–240 L/ac) during early summer for most species.</li> <li>• Some weed species may require a second application.</li> </ul>
ESCORT (60%) + non-ionic surfactant	20–30 g/ha 0.2% v/v	8–12 g/ac 0.2% v/v	<ul style="list-style-type: none"> <li>• Product rates vary depending on the type of weed species targeted. Refer to Table 18-1. <i>Susceptibility of Various Weeds to Non-Crop Land Herbicides</i>, page 365 for the appropriate rate.</li> </ul>
metsulfuron methyl	12–18 g/ha		<ul style="list-style-type: none"> <li>• Apply postemergence to young (less than 10 cm tall or across) annual weeds, biennial and perennial weeds up to the early bud stag. Weeds should be actively growing at the time of application.</li> <li>• Temporary chlorosis, height reduction or growth suppression of desired grass species may occur.</li> </ul>

## VEGETATION MANAGEMENT – LONG TERM NON-SELECTIVE

In certain areas (such as in rights-of-way facilities yards, in storage yards, on railway tracks, beneath guide rails, and under fences at road intersections), it may be necessary to completely kill all vegetation for long-term control for safety, access and flammability concerns.

**CAUTION:** These chemicals should not be used to treat areas that are close to gardens, desirable trees, etc. Since these chemicals are non-selective (will kill any plant that they contact), special care must be used in their application. If the area (for example, a facilities yard) is higher than a nearby lawn, the chemical may wash onto the lawn with the first rain. If trees or shrubs are feeding under the treated areas, the chemical may leach to their roots and cause injury.

It may be desirable to maintain certain areas completely free of vegetation. Usually two problems are involved. First, the existing vegetation must be destroyed, including the destruction of underground stems and roots of perennials. Second, the bare area thus produced must be maintained either by persistent soil active chemicals or by foliage treatment of emerged weed seedlings and plants.

Some chemicals will kill existing vegetation. Others, while excellent for maintaining the bare area, may be used more economically if combined with another chemical to kill existing growth. If a mixed population of weeds is present, combinations of chemicals that will kill the different weed types may be used advantageously.

Uniform coverage with all chemicals is essential. Touch up operations should be expected, as a single treatment will seldom give complete eradication. Usually 2 applications of the lower recommended rate (i.e. 5.5–11 kg/ha), depending on the chemical used, spaced 6–12 months apart, give better results than a single application of the higher recommended rate. This approach also reduces the risk of off-site movement.

### Bare Areas – Non selective control of all vegetation

ARSENAL (240 g/L)	3 L/ha	1.2 L/ac	• Apply in sufficient water (100–550 L/ha (40–220 L/ac)) to wet all foliage during periods of active growth.
<i>imazapyr</i>	0.72 kg/ha		• Do NOT graze the treated area or cut for hay. • Do NOT apply in areas where tree roots may extend into the treated area.
DIUREX 80WDG or KARMEX (80 DF)	11.25 kg/ha	4.5 kg/ac	• Apply in sufficient water (250–400 L/ha (100–160 L/ac)). • The level and duration of weed control may be affected by soil type and organic matter. A sandier soil, low in organic matter may exhibit longer periods of weed control versus a heavier clay soil that is high in organic matter.
<i>diuron</i>	9 kg/ha		
glyphosate (360 g/L)* <i>or</i> glyphosate (480 g/L)* <i>or</i> glyphosate (500 g/L)* <i>or</i> glyphosate (540 g/L)*	10–20 L/1,000 L 7.5–15 L/1,000 L 7.2–14.4 L/1,000 L 6.67–13.3 L/1,000 L		• Controls established plants of most woody and herbaceous species. Can be applied whenever plants are green and actively growing. • No residual control is provided.
glyphosate	3.6–7.2 kg/1,000 L		
HYVAR X-L (240 g/L)	25.7–45 L/ha	10.3–18 L/ac	• Mullein is not adequately controlled by HYVAR X-L.
<i>bromacil</i>	6.16–10.8 kg/ha		
KROVAR ((1:1)80 DF)	13.5–18 kg/ha	5.4–7.2 kg/ac	
<i>bromacil/ diuron</i>	10.8–14.4 kg/ha		

\* See Table 4-1. *Herbicides Used in Ontario*, page 29 for formulations available. See label for specific uses and rates.

TRADE NAME (Concentration) active ingredient	PRODUCT RATE PER HECTARE active rate per ha	PRODUCT RATE PER ACRE	PRECAUTIONS
PAYLOAD WDG (51.1%) + glyphosate (360 g/L)*	280–420 g/ha 3.3 L/ha	112–168 g/ac 1.3 L/ac	<ul style="list-style-type: none"> <li>• Do NOT apply on soils with &gt; 5% organic matter, or fine textured soils.</li> <li>• Do NOT apply to farm alleys or roads where traffic may result in treated dust settling onto crops or other desirable vegetation.</li> <li>• Do NOT apply with 100 metres of non-dormant pears.</li> <li>• Do NOT make more than two applications per growing season.</li> <li>• Apply high rate to medium textured soils.</li> <li>• Apply low rate to coarse textured soils.</li> <li>• This tank-mix provides residual control only for pigweed spp. common ragweed, lamb's-quarters, green foxtail, hairy nightshade, dandelion and eastern black nightshade.</li> </ul>
flumioxazin + glyphosate	0.143–0.286 kg/ha 1.2 kg/ha		

\* See Table 4-1. *Herbicides Used in Ontario*, page 29 for formulations available. See label for specific uses and rates.

## Strategies for Managing Woody Species

There are several techniques that may be used for the herbicide control of woody species such as stem foliage sprays, basal bark sprays and frilling or stump treatments. The choice of technique will depend on such factors as targeted woody plant species, accessibility of land, availability of equipment, proximity to susceptible crops or ornamental vegetation and the size of the control program.

### Foliage Treatment

Foliage treatment of brush is more appropriate for smaller growth (less than 3 m in height). Treatments should be applied to thoroughly wet the foliage just to the point of runoff. This technique is most effective just after full leaf development in late spring or early summer.

### Basal Bark Treatment

The basal bark treatment is useful on a wide range of trees and brush with a trunk diameter up to 10 cm. There are a number of different basal bark techniques including one-sided low volume, thin line and streamline.

### Stump Treatment

In many cases, it is more desirable to remove existing brush by hand than to spray it and leave the dead material standing. Cut-stump treatment is used for trees 10 cm and above in areas where a falling dead tree (following basal bark treatment) could be hazardous. Most treatments must be applied to freshly cut stumps to achieve maximum effectiveness.

### Tree Injection

Glyphosate as a 0.15 g EZJECT capsule can be used to control woody brush and trees with an EZJECT capsule injection system. Capsules must penetrate through the outer bark and into the inner living tissue to provide effective results. Capsules should be spaced evenly around the tree, below all major branches at a rate of 1 capsule per 5 cm stem diameter at breast height (dbh). Stems should be in excess of 3 cm in diameter but usually not in excess of 20 cm in diameter. Trees should not be frozen at time of treatment. Allow 1–2 years for complete control.

<b>BRUSH CONTROL</b>			
<b>Stem Foliage Treatments Applied to Runoff – Most deciduous woody species</b>			
Stem foliage treatment of brush should be limited to smaller growth (less than 2 m in height). Treatments should be applied to thoroughly wet the stems and foliage to the point of runoff. This technique is most effective just after full leaf development in late spring or early summer.			
The choice of herbicides for controlling stands of deciduous brush should be based on the susceptibilities of the predominant species (Table 18-2. Susceptibility of Woody Plants to Various Herbicides and Mixtures as Foliage Sprays, page 378) or whether the brush to be controlled is near homes, recreational areas, sensitive crops etc.			
2,4-D Ester 600 (564 g/L)* <b>or</b> 2,4-D Ester 700 (660 g/L)*	3–8 L 3.25–6.78 L	1.2–3.2 L 1.3–2.7 L	<ul style="list-style-type: none"> <li>Apply in 1,000–3,000 L/ha water (400–1,200 L/ac).</li> <li>Apply to sensitive brush species up to 3 m tall after foliage is developed.</li> <li>Brush above 3 m tall should be cut close to the ground and sprayed when the re-growth is over 0.6 m tall. Repeat treatments may be required.</li> </ul>

#### Basal-Bark Treatments in Oil as a Carrier

The basal-bark treatment is useful on a wide range of trees and brush with a trunk diameter up to 10 cm. There are a number of different basal bark techniques including one-sided low volume, thin line and streamline. For oak, hickory, basswood or ash, treatment applications are most effective from February to June. Most other species may be treated at any season of the year. Light, simple equipment, coupled with the possibility of winter operations when access to swampy areas is possible, give this treatment an important role in a brush control program.

dichlorprop/2,4-D (610 g/L)* <b>or</b> dichlorprop/2,4-D (582 g/L)*	1.6–2.2 L/100 L 2.3–3.2 L/100 L	<ul style="list-style-type: none"> <li>• For most woody species, including conifers.</li> <li>• Mix with mineral oil as a carrier.</li> <li>• Use lower rates for susceptible species and higher rates for hard to kill species.</li> <li>• Spray bark to wet only.</li> <li>• This treatment is not effective for basswood and ash.</li> </ul>
GARLON XRT (755 g/L) <b>or</b> GARLON RTU (144 g/L)	13–19 L/100 L see precautions	<ul style="list-style-type: none"> <li>• For most woody species, not including conifers.</li> <li>• Mix GARLON XRT in enough mineral or vegetable oil for a 100 L spray mixture.</li> <li>• <b>One Sided Low Volume</b> – This low volume treatment can be applied to stems less than 15 cm in diameter. Apply the spray to thoroughly wet at least one side of the stem and root crown but not to the point of run-off.</li> <li>• <b>Streamline</b> – Apply sufficient spray to one side of stems less than 8 cm in basal diameter to form a band that is 5 cm in width. The treatment zone should widen to encircle the stem within 30 minutes. Treat both sides of stems which are 8–12 cm in basal diameter.</li> <li>• GARLON RTU is a ready to use blend of triclopyr and mineral oil. Apply in the same manner as GARLON XRT.</li> </ul>
triclopyr	9.8–14.35 kg/100 L	

#### Stump Treatment After Cutting to Most Deciduous Woody Species

In many cases, it is more desirable to remove existing brush by hand than to spray it and leave the dead material standing. Herbicide stump treatment is particularly useful in preventing the vigorous regrowth that is the characteristic response of many deciduous species after cutting. Moreover killing the stump is the first step towards encouraging it to rot.

Most treatments must be applied to freshly cut stumps to achieve maximum effectiveness. For old stumps, it is best to drill several holes or to split stump with a wedge before applying the treatments. Spray regrowth from an old stump along with the stump. Various dye materials may be added to the oil based sprays to assure that all exposed surfaces of the stumps are treated.

dichlorprop/2,4-D (610 g/L)* <b>or</b> dichlorprop/2,4-D (582 g/L)*	2.25 L/100 L 3.25 L/100 L	<ul style="list-style-type: none"> <li>• Apply in mineral oil as a carrier.</li> </ul>

## EVERGREEN OR CONIFER CONTROL

### Stem Foliage Treatments with Water as a Carrier

All of the treatments are applied so as to thoroughly wet all foliage. Use low pressure and apply from 500–1,500 L/ha solution (200–600 L/ac), depending on the amount of foliage. Thorough coverage is particularly important and the addition of a wetting agent will increase effectiveness.

TORDON 101 ((1:3.7) 305 g/L)	10 L/1,000 L		<ul style="list-style-type: none"> <li>Apply when the conifers are actively growing in early summer.</li> <li>Spray should thoroughly wet all plant parts including stem, foliage, and root collar.</li> <li>Add 0.25% v/v solution of Sylgard 309 surfactant when controlling conifers.</li> <li>A permit is required for purchase and use.</li> </ul>

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

# 19. WATER WEEDS (AQUATIC PLANTS)

## Water Weeds (Aquatic Plants)

### Types of Aquatic Plants

Aquatic vegetation can vary widely; species include completely submerged plants such as Canada waterweed and algae; free floating plants such as water lilies; and emergent plants such as cattails and bulrushes. Many emergent plants will grow equally well on the moist shoreline or when their lower stems and roots are in water. Where these emergent species have taken possession of the shoreline, control measures must embrace that area as well as the water.

Stonewort and muskgrass are a gray-green to green plant-like algae, attached to the sediment, or free floating. In dense communities this plant-like algae has a very strong musk odour. It is brittle to the touch and will dry to a white powder upon removal from the water.

Tapegrass (wild celery) which is found in many recreational lakes, is resistant to all the currently recommended herbicides. It has long rubbery leaves and numerous short roots. Control is possible only by mechanical methods.

### Aquatic Herbicide Controls

Under the *Pesticides Act* and Ontario Regulation 63/09 a person requires an Aquatic Vegetation exterminator licence to use a herbicide to control aquatic plants and a permit issued by the Ministry of the Environment (MOE) to perform a water extermination unless exempt under the Regulation.

Subsection 82 and 83 of the Regulation provide the authorization to perform water exterminations and prescribe the exemptions from requiring a water exterminator's licence and/or permit for the performance of a water extermination.

Subsection 83(2) of the Regulation exempts a person from requiring an Aquatic Vegetation licence if he/she performs a water extermination in, on or over a portion of surface water that is located within the boundaries of premises owned or occupied by him/her (or his/her full time employer).

Subsection 83(3) of the Regulation exempts a person from requiring a permit to perform a water extermination if:

- He/she performs a water extermination in, on or over a portion of surface water that is located within the boundaries of premises owned or occupied by him/her (or his/her full time employer), and,
- the extermination is being done on a water body that is wholly contained on those premises and the water body does not discharge, directly or indirectly (other than by percolation) into any water or watercourse that is located wholly or partly outside the boundary of the premises.

A drainage ditch is defined in the Regulation as an artificial watercourse, added to the natural land drainage system, primarily to collect and convey water and that, for some period each year, does not contain moving water.

The use of pesticides in a drainage ditch to control plants that emerge from or float on the surface of the water as long as the drainage ditch does not contain moving water at the time of the extermination does not require a permit under the following conditions:

- A licensed exterminator, or a farmer who has successfully completed the Grower Pesticides Safety Course (i.e., a qualified farmer) applying Class 3, 4, 5, 6 or 7 pesticides that are appropriately labelled for that use.
- A person using Class 5, 6 or 7 pesticides that are appropriately labelled for that use.
- A farmer using Class 4 pesticides that are appropriately labelled for that use.

### Sale of Aquatic Herbicides

In Ontario, aquatic herbicides are classified as non-domestic pesticide products (Class 3 or 4). Licensed pesticide vendors may sell an aquatic herbicide only to those persons that possess the appropriate licence and/or permit or present a letter signed by the MOE Director under the Act confirming that the person presenting the letter is exempt from an exterminator licence and/or permit.

A person who holds an Aquatic Vegetation exterminator licence may purchase a Class 3 or 4 herbicide for aquatic plant control. However, as noted above, a permit is required unless the exterminator is performing a water extermination on premises he/she owns or occupies or on premises that are owned or occupied by his/her full-time employer and the

extermination is being done in, on, or over surface water that is wholly contained on those premises and the water body does not discharge, directly or indirectly (other than by percolation) into any water or watercourse that is located wholly or partly outside the boundary of the premises.

In situations where a person is exempt from both the requirement for an Aquatic Vegetation exterminator licence and a permit (as described above) the person must obtain a letter signed by an MOE Director under the Act confirming that he/she is exempt from requiring an Aquatic Vegetation exterminator licence and present the letter to the vendor to purchase a Class 3 or 4 herbicide for aquatic plant control.

Qualified farmers can purchase Class 3 and 4 pesticides for use in their own agricultural operation. Therefore, the above noted licence and/or permit exemptions apply. Farmers who present a registration number under the *Farm Registration and Farm Organization Funding Act, 1993*, or a signed Farmer Self Declaration form can purchase a Class 4 pesticide for use in their own agricultural operation.

### **Non-chemical Control Methods**

Management techniques for vegetation control in ponds include minimizing nutrient input, dredging excess sediment, logs and other organic debris, decreasing the surface to depth ratio and increasing

the rate of pond turnover (flushing). Some aquatic plant and algae life should be accepted and tolerated as a vital component of a healthy ecosystem.

Reducing or eliminating the flow of nutrients into water bodies is an effective preventative measure to control excessive aquatic weeds. Herbicides only provide temporary control of nuisance aquatic vegetation. Alternate methods such as mechanical removal of submergent plants, dredging or substrate alteration of drainage ditches can provide longer-term control. Mechanical control measures may have an impact on fish habitat and therefore would require approval from the Ministry of Natural Resources.

M – Manual or mechanical methods equally as effective as herbicides.

M\* – Manual or mechanical methods are generally more effective than herbicides.

M\*\* – Manual or mechanical methods are the only control measure currently available.

# Bur reed is also very common as a submerged plant in ecotypes C and D.

<sup>A</sup> Weeds denoted with an "R" may be damaged but will likely recover.

\* – A typical Muskoka lake is an example of a soft water lake.

\*\* – A typical Kawartha lake is an example of a hard water lake.

\*\*\* – A wet ditch contains water at time of treatment.

\*\*\*\* – A dry ditch contains no water at time of treatment.

(1) Copper compound (POLYDEX).

(2) Diquat (REGLONE A).

(3) Amitrole (AMITROLE 240).

**TABLE 19-1. Habitats and Herbicide Susceptibility of Common Aquatic Plants (cont'd)**

Duckmeal ( <i>Wolffia</i> spp.)	R	C-I	I-R	VC				R	S	

VC – very common; C – common; I – infrequent; R – rare

S – susceptible; I – intermediate; R – resistant.

M – Manual or mechanical methods equally as effective as herbicides.

M\* – Manual or mechanical methods are generally more effective than herbicides.

M\*\* – Manual or mechanical methods are the only control measure currently available.

# Bur reed is also very common as a submerged plant in ecotypes C and D.

<sup>A</sup> Weeds denoted with an "R" may be damaged but will likely recover.

\* – A typical Muskoka lake is an example of a soft water lake.

\*\* – A typical Kawartha lake is an example of a hard water lake.

\*\*\* – A wet ditch contains water at time of treatment.

\*\*\*\* – A dry ditch contains no water at time of treatment.

(1) Copper compound (POLYDEX).

(2) Diquat (REGLONE A).

(3) Amitrole (AMITROLE 240).

redroot pigweed

common ragweed

spreading atriplex

lamb's-quarters

green foxtail

eastern black nightshade

Emerged weeds are most susceptible to postemergence herbicides when they are small and actively growing.

# 20. APPENDICES

## APPENDIX A. Contributors to Guide to Weed Control, 2012–2013

### Members of the Ontario Weed Committee

Website: [www.ontarioweeds.com/weedcommittee.php](http://www.ontarioweeds.com/weedcommittee.php)

### Ontario Ministry of Agriculture, Food and Rural Affairs

M. Cowbrough (Editor – Field Crops, Notes on Herbicides, Adjuvants), Guelph  
K. Callow (Editor – Horticulture Crops), Ridgetown  
J. Kyle, Lindsay  
G. Quesnel, Kemptville

### Ontario Ministry of the Environment

Violet van Wassenaer, Toronto

### Ontario Pesticides Advisory Committee

A. Hamill, Harrow

### Ontario Ministry of Natural Resources

M. Irvine, Sault Ste. Marie

### University of Guelph

Plant Agriculture  
C.J. Swanton, Guelph  
F. Tardif, Guelph  
D. Robinson, Ridgetown  
P. Sikkema, Ridgetown

### Agriculture and Agri-Food Canada

R. Nurse, Harrow  
E. Page, Harrow

### Health Canada, Pest Management Regulatory Agency

Vacant, Guelph

### Crop Protection Institute of Canada

K. Hyatt, Guelph

### Certified Crop Advisor (CCA)

C. Chapple, Blenheim

### Members at Large

N. Cain, Acton  
P. Lynch, Shakespeare

### Farm and Commodity Group Members

#### Innovative Farmers Association of Ontario

S. Johns, Seaforth

#### Grain Farmers of Ontario

M. Moran, Guelph

#### Ontario Soil & Crop Improvement Association

A. Mol, Thunder Bay

#### Ontario White Bean Growers, London

L. Anderson, Kent Bridge

**Acid Equivalent (abbreviation – a.e.) (2,4-D, glyphosate)** – the active part of the acid herbicide being used – usually indicated in grams/L on the label.

**Active Ingredient** – the chemical in a formulated product that is responsible for the herbicide effects.

**Adjuvant** – an ingredient added to a herbicide formulation or spray mixture to aid or modify the action of the herbicide, or the physical characteristics of the mixture.

## APPENDIX B. Weed Control Glossary

**Amine** – acid or anionic herbicides can be formulated as ammonium salts or amines. 2,4-D amines are relatively non-volatile under most climatic conditions.

**Annual Plant** – completes its life cycle within a one-year period. Summer annuals complete their life cycle between spring and fall. Winter annuals germinate in fall, overwinter and then flower and complete their life cycle the following spring or summer.

**Band Treatment** – a herbicide applied as a narrow strip over the crop row, usually followed by inter-row cultivation.

**Biennial Plant** – completes its life cycle within a two-year period. Germinates in the spring, overwinters, flowers the following spring or summer and dies back the following fall.

**Carrier** – the diluent or material added to a herbicide product to facilitate its even distribution over the target area. The carrier is often water but it may also be granular products, oil or other solvents.

**Compatible** – compounds or formulations that can be mixed and applied together without undesirably altering their separate effects or the physical properties of the mixture.

**Contact Chemicals** – chemicals that kill only the parts of the plant on which they are sprayed. Movement within the plant is minimal.

**Cotyledons** – the seed leaves. Often visible when large seeds are opened. These are the first leaves visible in the germinated seedling. Broad-leaved crops or weeds have two cotyledons (dicots). Grasses (monocots) have one.

**Directed Treatment** – a treatment directed onto the weeds or soil in such a manner as to avoid contact with the crop.

**Dormant** – a resting stage similar to the condition of a plant during the winter.

**Emergence** – the time at which the seedling first appears above the ground.

**Escape** – a plant in a treated area that has been missed or survived the treatment.

**Ester** – some acid herbicides are reacted with alcohols to produce ester formulations. Ester formulations of 2,4-D and related herbicides can vaporize under hot conditions after treatment and cause unwanted damage by moving away from the treated area.

**Formulation** – means the same as Product – an active ingredient processed with other materials or formulants to make it easier to apply and/or more effective. Herbicides are rarely sold as pure active ingredients (2,4-D acid), they are sold as formulated mixtures (i.e. 2,4-D amine, sodium salt

or ester with added emulsifiers, adjuvants, carriers, etc.).

**GMO** – a genetically modified organism (GMO) is an organism whose genetic material has been altered using genetic engineering techniques as opposed to traditional breeding methods.

**GPS** – global positioning system (GPS) is a space based global navigation satellite system that provides location and time information. Its primary application in pest management has been for accurate navigation of equipment so as to minimize the overlaps of pesticide applications.

**Half-Life** – the time required for 50% of a herbicide to be degraded or inactivated in soil or water.

**Herbicide** – a chemical that is toxic to plants.

**Herbicide Tolerant Crops (abbreviation – HTCs)** – New varieties of crops that have been developed by classical breeding or transgenic techniques to be tolerant to specific herbicides.

**Hormone-Type Herbicide** – includes 2,4-D, 2,4-DB, mecoprop MCPA, MCPB, dichlorprop, dicamba and triclopyr, picloram. At extremely low concentrations, these chemicals can stimulate and/or disrupt the growth of broadleaved plants.

**Non-Selective Herbicide** – a chemical used in such a manner that all exposed vegetation is damaged.

**Perennial Plant** – lives for more than 2 years.

**Product** – the contents of a herbicide container as marketed. In addition to the active ingredient, it may also contain other solvents, surfactants or carriers that are referred to as inert ingredients or formulants.

**Program** – application of one or more herbicides at two different stages of crop and/or weed growth. The second herbicide application is used to provide control of the weeds either escaping the original herbicide treatment or that are problems at different periods in the growth of the crop.

**Resistant Weeds (Herbicide Resistant Weeds)** – the inherited ability of some weeds in the population of a particular weed species to survive a herbicide application to which most of the original population was susceptible.

**Selective Herbicide** – a chemical used in such a manner that it will kill weeds on a growing crop without damaging the crop.

**Sodium Salt** – some acid or anionic herbicides can be formulated as sodium salts (e.g. 2,4-D).

**Soil Sterilant** – a soil active herbicide that is applied at a sufficiently high rate to prevent all plant growth for at least one season.

**Surfactant** – a chemical added to the herbicide formulation or to the spray solution to improve the dispersing, spreading, sticking or wetting properties of the spray mixture.

**Susceptible** – a crop that may be damaged or a weed that may be readily controlled by a recommended rate of herbicide.

**Tank-Mix** – two chemicals that are packaged separately and mixed in the sprayer tank.

**Translocated Herbicide** – a chemical herbicide that moves within the plant.

## APPENDIX C. Ontario Ministry of Agriculture, Food and Rural Affairs Crop Advisory Staff List

Denise Beaton Crop Protection Program Lead Tel: 519-826-6594 Fax: 519-826-4964 <a href="mailto:denise.beaton@ontario.ca">denise.beaton@ontario.ca</a>	Kristen Callow Weed Management Program Lead – Horticulture Tel: 519-674-1335 <a href="mailto:kristen.callow@ontario.ca">kristen.callow@ontario.ca</a>	Jim Chaput Minor Use Coordinator Tel: 519-826-3539 Fax: 519-826-4964 <a href="mailto:jim.chaput@ontario.ca">jim.chaput@ontario.ca</a>	Mike Cowbrough Weed Management Field Crops Program Lead Tel: 519-824-4120 ext. 52580 Fax: 519-763-8933 <a href="mailto:mike.cowbrough@ontario.ca">mike.cowbrough@ontario.ca</a>
---	--	---	---

A complete list of Ontario Ministry of Agriculture, Food and Rural Affairs advisory staff is available on the OMAFRA website at [www.ontario.ca/crops](http://www.ontario.ca/crops).

### **Agricultural Information Contact Centre**

Provides province-wide, toll-free technical and business information to commercial farms, agri-businesses and rural businesses.

1 Stone Road West, Guelph, ON N1G 4Y2 • Tel: 519-826-4047 • Toll-free: 1-877-424-1300 • Fax: 519-826-7610 • E-mail: [ag.info.omafra@ontario.ca](mailto:ag.info.omafra@ontario.ca)

## APPENDIX D. Ontario Ministry of Environment – Regional Offices Contact Information

<b>REGION</b> <b>County</b>	<b>Address</b>	<b>Telephone/Fax</b>
<b>Central Region</b> Toronto, Halton, Peel, York, Durham, Muskoka, Simcoe	5775 Yonge Street, 8th Floor Toronto, ON M2M 4J1	Tel: 416-326-6700 Toll Free: 1-800-810-8048 Fax: 416-325-6345

## APPENDIX F. The Metric System

### **Linear Measures (length)**

10 millimetres (mm) = 1 centimetre (cm)  
 100 centimetres (cm) = 1 metre (m)  
 1,000 metres = 1 kilometre (km)

### **Square Measures (area)**

100 m × 100 m = 10,000 m<sup>2</sup> = 1 hectare (ha)  
 100 ha = 1 square kilometre (km<sup>2</sup>)

### **Cubic Measures (volume)**

#### *Dry Measure*

1,000 cubic millimetres (mm<sup>3</sup>) = 1 cubic centimetre (cm<sup>3</sup>)  
 1,000,000 cm<sup>3</sup> = 1 cubic metre (m<sup>3</sup>)

#### *Liquid Measure*

1,000 millilitres (mL) = 1 litre (L)  
 100 L = 1 hectolitre (hL)

### **Weight-Volume Equivalents (for water)**

(1.00 kg) 1,000 grams = 1 litre (1.00 L)  
 (0.50 kg) 500 g = 500 mL (0.50 L)  
 (0.10 kg) 100 g = 100 mL (0.10 L)  
 (0.01 kg) 10 g = 10 mL (0.01 L)  
 (0.001 kg) 1 g = 1 mL (0.001 L)

### **Weight Measures**

1,000 milligrams (mg) = 1 gram (g)  
 1,000 g = 1 kilogram (kg)  
 1,000 kg = 1 tonne (t)  
 1 mg/kg = 1 part per million (ppm)

### **Dry-Liquid Equivalents**

1 cm<sup>3</sup> = 1 mL  
 1 m<sup>3</sup> = 1,000 L

### **Metric to Imperial (Approximate)**

litres per hectare × 0.09 = gallons per acre  
 litres per hectare × 0.36 = quarts per acre  
 litres per hectare × 0.71 = pints per acre  
 millilitres per hectare × 0.015 = fluid ounces per acre  
 grams per hectare × 0.015 = ounces per acre  
 kilograms per hectare × 0.89 = pounds per acre  
 tonnes per hectare × 0.45 = tons per acre

### **Imperial to Metric (Approximate)**

gallons per acre × 11.23 = litres per hectare (L/ha)  
 quarts per acre × 2.8 = litres per hectare (L/ha)  
 pints per acre × 1.4 = litres per hectare (L/ha)  
 fluid ounces per acre × 70 = millilitres per hectare (mL/ha)  
 tons per acre × 2.24 = tonnes per hectare (t/ha)  
 pounds per acre × 1.12 = kilograms per hectare (kg/ha)  
 ounces per acre × 70 = grams per hectare (g/ha)

### **Liquid Equivalents**

Litres/Hectare	Approximate Gallons/Acre
50	5
100	10
150	15
200	20
250	25
300	30

### **Dry Weight Equivalents**

Grams/Hectare	Ounces/Acre
100	1 ½
200	3
300	4 ¼
500	7
700	10

Kilograms/Hectare	Pounds/Acre
1.10	1
1.50	1 ¼
2.00	1 ¾
2.50	2 ¼
3.25	3
4.00	3 ½
5.00	4 ½
6.00	5 ¼
7.50	6 ¾
9.00	8
11.00	10
13.00	11 ½
15.00	13 ½

### **Metric Conversions**

5 mL = 1 tsp  
 15 mL = 1 tbsp  
 28.5 mL = 1 fl. oz

## Conversion Tables — Metric to Imperial

### Length

1 millimetre (mm) = 0.04 inch  
 1 centimetre (cm) = 0.40 inch  
 1 metre (m) = 39.40 inches  
 1 metre (m) = 3.28 feet  
 1 metre (m) = 1.09 yards  
 1 kilometre (km) = 0.62 mile

### Area

1 square centimetre (cm<sup>2</sup>) = 0.16 square inch  
 1 square metre (m<sup>2</sup>) = 10.77 square feet  
 1 square metre (m<sup>2</sup>) = 1.20 square yards  
 1 square kilometre (km<sup>2</sup>) = 0.39 square mile  
 1 hectare (ha) = 107,636 square feet  
 1 hectare (ha) = 2.5 acres

### Volume (dry)

1 cubic centimetre (cm<sup>3</sup>) = 0.061 cubic inch  
 1 cubic metre (m<sup>3</sup>) = 1.31 cubic yards  
 1 cubic metre (m<sup>3</sup>) = 35.31 cubic feet  
 1,000 cubic metres (m<sup>3</sup>) = 0.81 acre-foot  
 1 hectolitre (hL) = 2.8 bushels

### Volume (liquid)

1 millilitre (mL) = 0.035 fluid ounce  
 1 litre (L) = 1.76 pints  
 1 litre (L) = 0.88 quart  
 1 litre (L) = 0.22 gallon (Imp.)  
 1 litre (L) = 0.26 gallon (U.S.)

### Weight

1 gram (g) = 0.035 ounce  
 1 kilogram (kg) = 2.21 pounds  
 1 tonne (t) = 1.10 short tons  
 1 tonne (t) = 2,205 pounds

### Pressure

1 kilopascal (kPa) = 0.15 pounds/in<sup>2</sup>

### Speed

1 metre per second = 3.28 feet per second  
 1 metre per second = 2.24 miles per hour  
 1 kilometre per hour = 0.62 miles per hour

### Temperature

$^{\circ}\text{F} = (^{\circ}\text{C} \times 9/5) + 32$

## Conversion Tables – Imperial to Metric

### Length

1 inch = 2.54 cm  
 1 foot = 0.30 m  
 1 yard = 0.91 m  
 1 mile = 1.61 km

### Area

1 square foot = 0.09 m<sup>2</sup>  
 1 square yard = 0.84 m<sup>2</sup>  
 1 acre = 0.40 ha

### Volume (dry)

1 cubic yard = 0.76 m<sup>3</sup>  
 1 bushel = 36.37 L

### Volume (liquid)

1 fluid ounce (Imp.) = 28.41 mL  
 1 pint (Imp.) = 0.57 L  
 1 gallon (Imp.) = 4.55 L  
 1 gallon (U.S.) = 3.79 L

### Weight

1 ounce = 28.35 g  
 1 pound = 453.6 g  
 1 ton = 0.91 tonne

### Pressure

1 pound per square inch = 6.90 kPa

### Temperature

$^{\circ}\text{C} = (^{\circ}\text{F} - 32) \times 5/9$

### TEMPERATURE

For exact values the formula is:

Fahrenheit to Celsius: subtract 32 from number of °F, then multiply by 5/9.

Celsius to Fahrenheit multiply °C by 9/5 then add 32.

## Abbreviations

%	= per cent (by weight)	km/h	= kilometres per hour
ai	= active ingredient	kPa	= kilopascal
AP	= agricultural powder	L	= litre
cm	= centimetre	m	= metre
cm <sup>2</sup>	= square centimetre	m/s	= metres per second
DG	= dispersible granular	m <sup>2</sup>	= square metre
DP	= dispersible powder	mL	= millilitre
E	= emulsifiable	mm	= millimetre
e.g.	= for example	SC	= sprayable concentrate
EC	= emulsifiable concentrate	SP	= soluble powder
F	= flowable	t	= tonne
g	= gram	W	= wettable (powder)
Gr	= granules, granular	WDG	= water dispersible granular
ha	= hectare	WP	= wettable powder
kg	= kilogram

# Emergency and First-Aid Procedures for Pesticide Poisoning

For a major spill, a theft or a fire involving a pesticide call the Ministry of the Environment at  
**1-800-268-6060.**

For pesticide poisonings and pesticide injuries call the Poison Information Centre:

Toronto      1-800-268-9017  
                1-877-750-2233 (TTY)

## PREVENT ACCIDENTS

- **Read the label.** Follow all the precautions the label recommends. Read the First Aid section of the label BEFORE you begin to handle any pesticide.
- **Make sure that someone knows what pesticides you are working with and where you are.**
- **Keep a file of labels and product Material Safety Data Sheets (MSDS) for the pesticides you use.** Make sure everyone knows where to find this in case of an emergency.
- **Post emergency numbers near all telephones.**
- **Keep clean water, paper towels, extra gloves and clean coveralls close by** in case you spill pesticide on yourself.

If someone has been working with pesticides and you see any possible symptoms of pesticide poisoning or injury, take emergency action immediately.

## IF AN ACCIDENT OR POISONING HAPPENS

- Protect yourself from injury first.
- Stop the exposure to the pesticide. Move the victim away from the contaminated area.
- Check the four basic facts — identify the pesticide, the quantity, the route of entry and time of exposure.
- Call an ambulance or the Poison Information Centre.
- Start first aid. This is not a substitute for professional medical help.
- **Provide the label, MSDS sheet or container to emergency personnel** at the scene — or take it with you to the hospital. Do not transport pesticide containers in the passenger compartment of the vehicle.

## FIRST AID

### If a pesticide comes in contact with skin:

- remove all contaminated clothing; wash skin thoroughly with lots of soap and warm water
- dry skin well and cover with clean clothing or other clean material.

### If pesticide comes in contact with eyes:

- hold eyelids open; wash the eyes with clean running water for 15 minutes or more.

### If pesticide was inhaled:

- move the victim to fresh air and loosen tight clothing
- give artificial respiration if the victim is not breathing.

**Do not breathe in the exhaled air from the victim — you could also be poisoned.**

### If a pesticide was swallowed:

- **call the Poison Information Centre IMMEDIATELY.**

**Emergency numbers are listed at the front of each Bell telephone directory.**

To obtain copies of this or any other OMAFRA publication, please order:

- online at [www.serviceontario.ca/publications](http://www.serviceontario.ca/publications)
- by phone through the ServiceOntario Contact Centre, Monday to Friday, 8:30 AM to 5:00 PM ET
  - 416-326-5300
  - 416-325-3408 (TTY)
  - 1-800-668-9938, toll-free across Canada
  - 1-800-368-7095 (TTY), toll-free across Ontario
- in person at ServiceOntario Centres across Ontario
